MB39C811

**Ultra Low Power Buck Power Management IC
for Solar/Vibrations Energy Harvesting**

Data Sheet (Full Production)

SPANSION®

Notice On Data Sheet Designations

Spansion Inc. issues data sheets with Advance Information or Preliminary designations to advise readers of product information or intended specifications throughout the product life cycle, including development, qualification, initial production, and full production. In all cases, however, readers are encouraged to verify that they have the latest information before finalizing their design. The following descriptions of Spansion data sheet designations are presented here to highlight their presence and definitions.

Advance Information

The Advance Information designation indicates that Spansion Inc. is developing one or more specific products, but has not committed any design to production. Information presented in a document with this designation is likely to change, and in some cases, development on the product may discontinue. Spansion Inc. therefore places the following conditions upon Advance Information content:

> "This document contains information on one or more products under development at Spansion Inc. The information is intended to help you evaluate this product. Do not design in this product without contacting the factory. Spansion Inc. reserves the right to change or discontinue work on this proposed product without notice."

Preliminary

The Preliminary designation indicates that the product development has progressed such that a commitment to production has taken place. This designation covers several aspects of the product life cycle, including product qualification, initial production, and the subsequent phases in the manufacturing process that occur before full production is achieved. Changes to the technical specifications presented in a Preliminary document should be expected while keeping these aspects of production under consideration. Spansion places the following conditions upon Preliminary content:

> "This document states the current technical specifications regarding the Spansion product(s) described herein. The Preliminary status of this document indicates that product qualification has been completed, and that initial production has begun. Due to the phases of the manufacturing process that require maintaining efficiency and quality, this document may be revised by subsequent versions or modifications due to changes in technical specifications."

Combination

Some data sheets contain a combination of products with different designations (Advance Information, Preliminary, or Full Production). This type of document distinguishes these products and their designations wherever necessary, typically on the first page, the ordering information page, and pages with the DC Characteristics table and the AC Erase and Program table (in the table notes). The disclaimer on the first page refers the reader to the notice on this page.

Full Production (No Designation on Document)

When a product has been in production for a period of time such that no changes or only nominal changes are expected, the Preliminary designation is removed from the data sheet. Nominal changes may include those affecting the number of ordering part numbers available, such as the addition or deletion of a speed option, temperature range, package type, or VIO range. Changes may also include those needed to clarify a description or to correct a typographical error or incorrect specification. Spansion Inc. applies the following conditions to documents in this category:

> "This document states the current technical specifications regarding the Spansion product(s) described herein. Spansion Inc. deems the products to have been in sufficient production volume such that subsequent versions of this document are not expected to change. However, typographical or specification corrections, or modifications to the valid combinations offered may occur."

Questions regarding these document designations may be directed to your local sales office.

MB39C811

**Ultra Low Power Buck Power Management IC
for Solar/Vibrations Energy Harvesting**

Data Sheet (Full Production)

SPANSION®

1. Description

The MB39C811 is the high efficient buck DC/DC converter IC which adopts the all-wave bridge rectifier using the low-dissipation and the comparator system. It achieves the energy harvest solution for the energy source of the high output impedance such as the piezoelectric transducer.

It is possible to select from eight preset output voltages and supply up to 100 mA of the output current.

2. Features

- Quiescent current (No load, Output in regulation) : 1.5μA
- Quiescent current (VIN = 2.5V UVLO) : 550nA
- Integrated Low Loss Full-Wave Bridge Rectifier
- VIN input voltage range : 2.6V to 23V
- Preset output voltage: 1.5V, 1.8V, 2.5V, 3.3V, 3.6V, 4.1V, 4.5V, 5.0V
- Output current : Up to 100mA
- Protection functions
- Shunt for input protection: VIN ≥ 21V, Up to 100mA Pull-down
- Over current limit
- I/O power-good detection signal output

3. Applications

- Light energy harvesting
- Piezoelectric energy harvesting
- Electro-Mechanical energy harvesting
- Wireless HVAC sensor
- Stand-alone nano-power buck regulator

Figure 9-1 AC characteristics
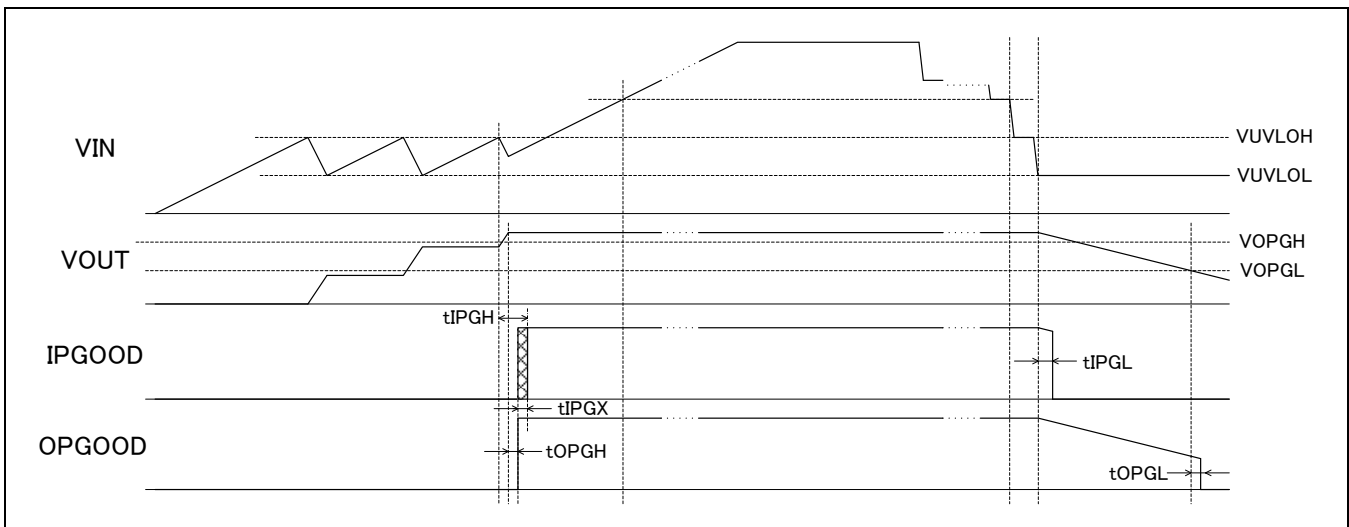

10. Function

10.1 Operational summary

Bridge rectifier

The A/C voltage which is input to the AC1_1 and AC1_2 pins or the AC2_1 and AC2_2 pins is all-wave rectified at the bridge rectifier of the low-dissipation diode. The bridge rectifier output is output from the DCOUT1 pin and the DCOUT2 pin. By connecting those outputs to the VIN pin, the electric charge is accumulated to the capacitor and it is used as the energy condenser of the buck converter.

Power supply for internal circuit

When the VIN pin voltage is 3.5 V or lower, the power supply is supplied from the VIN pin to the internal circuit directly. If the VIN pin is over 3.5 V, the internal regulator is activated and the power supply is supplied from the internal regulator to the internal circuit. Therefore, the stable output voltage is maintained in the wide input voltage range 2.6 V to 23 V.

DC/DC start-up/shut-down

When the VIN pin voltage is over the release voltage VUVLOH for the under voltage lockout protection circuit (UVLO), the converter circuit is enabled and the electric charge is supplied from the input capacitor to the output capacitor. When the VIN pin voltage is below the UVLO detection voltage VUVLOL, the converter is disabled. The 1.2 V hysteresis between the release voltage and the detection voltage for UVLO prevents the converter from noise or frequent ON/OFF which is caused by the VIN pin voltage-drop during start-up.

Sleep/auto active control

When the feedback voltage VFB for the converter reaches the determinate voltage, the sleep state to stop the switching operation starts and that can reduce the consumption power from the internal circuit. When the VOUT voltage is below the threshold value, the VOUT voltage is maintained to the rated value by making the converter active again.

10.2 Start-up/shut-down sequences

Figure 10-1 Timing chart
10.3 Function desctiptions

Output voltage setting & under voltage lockout protection (UVLO) function

It is possible to select the output voltage from eight kinds of presets using the S2, S1 and S0 pins.

Also, the under voltage lockout protection circuit is provided to prevent IC's malfunction by the transient state or the instant drop during the VIN pin voltage activation, system destroy and deterioration, and it is set as follows according to the preset voltage. When the VIN pin exceeds the release voltage for the UVLO circuit, the system is recovered.

Table 10-1 Output voltage setting & under voltage lockout protection (UVLO) function

S2	S1	S0	VOUT[V]	Under voltage lockout protection (UVLO) -Typ-	
				Detection voltage (Falling) VUVLOL [V]	Release voltage (Rising) VUVLOH [V]
L	L	L	1.5	2.8	4.0
L	L	H	1.8		
L	H	L	2.5		
L	H	H	3.3	4.0	5.2
H	L	L	3.6		
H	L	H	4.1	6.0	7.2
H	H	L	4.5		
H	H	H	5.0		

Input/output power-good signal output

When the VIN pin input voltage is equal to the release voltage VUVLOH for UVLO or more, the output for the IPGOOD pin is set to the "H" level as the input power-good. When the VIN pin input voltage is equal to the detection voltage VUVLOL for UVLO or less, the output for the IPGOOD pin is reset to the "L" level. The IPGOOD output is enabled only when the following output power-good signal output OPGOOD is "H" level.

The output power-good signal OPGOOD is set to the "H" level when the feedback voltage VFB for the VOUT pin is equal to the detection voltage VOPGH or more. When the feedback voltage VFB is equal to the reset voltage VOPGL or less, the output for the OPGOOD pin is reset to the "L" level.
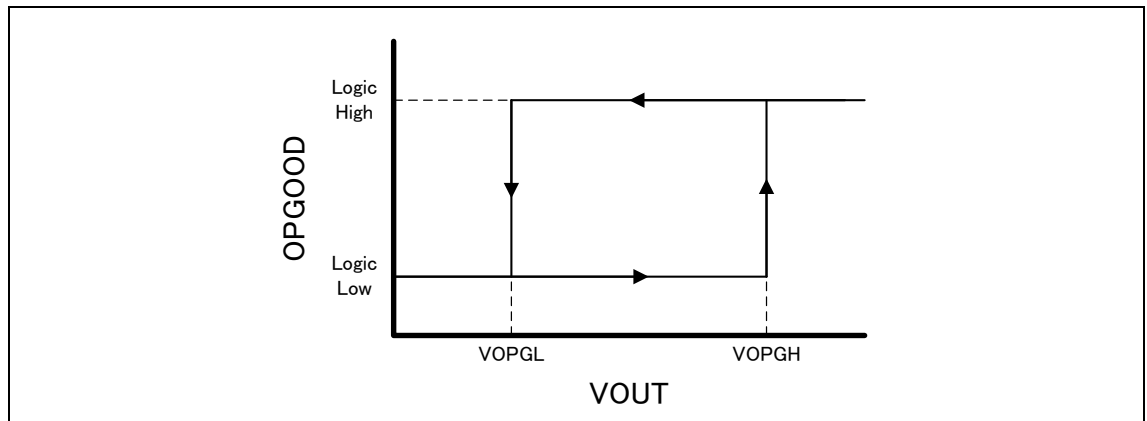

Table 10-2 Input power-good signal output (IPGOOD)

OPGOOD	UVLO	IPGOOD
L	Don't care	L
H	L	L
H	H	H

Table 10-3 Output power-good signal output (OPGOOD)

VFB	OPGOOD
≤ VOPGL	L
≥ VOPGH	H

Figure 10-2 Input/output power-good signal output

Input over voltage protection

If the voltage exceeding VSHUNT (Typ : 21V) is input to the VIN pin, the input level is clamped enabling the over voltage protection circuit. The flowing current is ISHUNT (Min 100mA) during clamp.

Over current protection

If the output current for the LX pin reaches the over current detection level IPEAK, the circuit is protected by controlling the peak value for the inductor current setting the main side FET to the OFF state.

11.   Typical Application Circuits

**Figure 11-1 Application circuit for light energy harvester**

**Figure 11-2 Application circuit for vibration energy harvester**

Figure 11-3 Voltage doubler rectification circuit for vibration harvester

Operation of the double voltage rectifier circuit rectifying an AC input voltage

When the AC1_1 input voltage is positive, the capacitor C4 charges up through the diode DD1, and when the AC1_1 input voltage is negative, the capacitor C5 charges up through the diode DD2. Each capacitor takes on a charge of the positive peak of the AC input. The output voltage at the VIN pin is the series total of C4+C5.

Table 11-1 Parts list

Part number	Value	Description
C1	10µF(*1)	Capacitor
C2	47µF(*1)	Capacitor
C3	4.7µF	Capacitor
C4	10µF(*1)	Capacitor
C5	10µF(*1)	Capacitor
L1	10µH to 22µH	Inductor

*1: Adjust the values according to the source supply ability and the load power.

12. Application Notes

Inductor
The MB39C811 is optimized to work with an inductor in the range of 10µH to 22µH. Also, since the peak switching current is up to 400mA, select an inductor with a DC current rating greater than 400mA.

Harvester (Photovoltaic power generator)
In case of photovoltaic energy harvesting, such as solar or light energy harvesting, use a solar cell with high open-circuit voltage which must be higher than the UVLO release voltage. Electric power obtained from light or solar is increased in proportion to the ambient illuminance. Silicone-based solar cells are single crystal silicon solar cell, polycrystalline silicon solar cell, and amorphous silicon solar cell. Organic-based solar cells are dye-sensitized solar cell (DSC), and organic thin film solar cell. Crystal silicon and polycrystalline silicon solar cells have high energy conversion efficiency. Amorphous silicon solar cells are lightweight, flexible, and produced at low cost. Dye-sensitized solar cells are composed by sensitizing dye and electrolytes, and are low-cost solar cell. Organic thin film solar cells are lightweight, flexible, and easily manufactured.

Harvester (Vibration power generator: Piezoelectric generator)
Vibration power generators produce AC power by vibration. For AC to DC rectification, the MB39C811 integrates two bridge rectifiers. Electric power obtained from a vibration power generator depends on frequency of vibration and usage of the generator. Although, piezoelectric generators produce high voltage, the shunt circuit protects from higher voltage than 21V. Piezoelectric generators are made from plastics or ceramics. Plastic-based piezoelectric generators made from polyvinylidene fluoride are lightweight, flexible, excellent impact resistance, waterproof, and easily manufactured. Ceramic-based piezoelectric generators are made from barium titanate or leas zirconate titanate ceramics.

Sizing of input and output capacitors
Energy from harvester should be stored on the Cin and Cout to operate the application block. If the size of these capacitors were too big, it would take too much time to charge energy into these capacitors, and the system cannot be operated frequently. On the other hand, if these capacitors were too small, enough energy cannot be stored on these capacitors for the application block. The sizing of the Cin and Cout is important.

Common capacitors are layered ceramic capacitor, electrolytic capacitor, electric double layered capacitor, and so on. Electrostatic capacitance of layered ceramic capacitors is relatively small. However, layered ceramic capacitors are small and have high voltage resistance characteristic. Electrolytic capacitors have high electrostatic capacitance from µF order to mF order. The size of capacitor becomes large in proportion to the size of capacitance. Electric double layered capacitors have high electrostatic capacitance around 0.5F to 1F, but have low voltage resistance characteristics around 3V to 5V. Be very careful with a voltage resistance characteristic. Also, leak current, equivalent series resistance (ESR), and temperature characteristic are criteria for selecting,

First of all, apply the following equation and calculate energy consumption for an application from voltage, current, and time during an operation.

$$E_{Appli.}[J] = V_{Appli.} \times I_{Appli.} \times t_{Appli.}$$

The energy stored on a capacitor is calculated by the following equation.

$$E_c[J] = \frac{1}{2}CV^2$$

Since the energy in a capacitor is proportional to the square of the voltage, it is energetically advantageous for the buck DC/DC converter to make the Cin larger.

An example of an application using the power gating by the OPGOOD signal is shown in the Figure 12-1. The Cin and the Cout are sized so as to satisfy the following equation. The η, the efficiency of the MB39C811, is determined from the current of application and the graph shown in Figure 13-1, Efficiency vs IOUT.
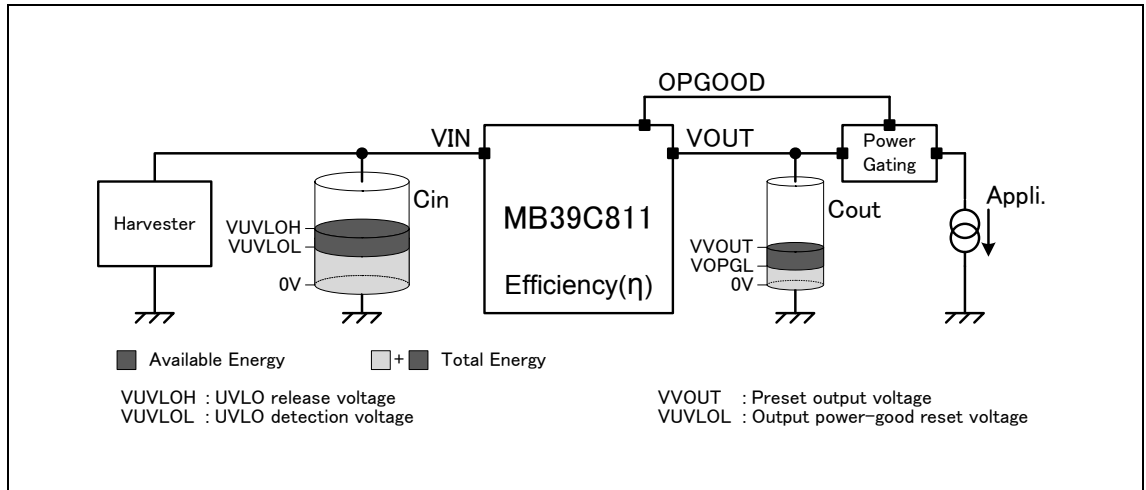

$$E_{Appli.} \leq dE_{Cin} \times \eta + dE_{Cout}$$

dE_{Cin} and dE_{Cout} are the available energies for the application.

$$dE_{Cin}[J] = \frac{1}{2}Cin(VUVLOH^2 - VUVLOL^2)$$

$$dE_{Cout}[J] = \frac{1}{2}Cout(VVOUT^2 - VOPGL^2)$$

Figure 12-1 Application example using the power gating by the OPGOOD signal

Before calculating the initial charging time ($T_{Initial}[s]$), calculate the total energy (E_{Cin} and E_{Cout}) stored on both Cin and Cout.

$$E_{Cout}[J] = \frac{1}{2}Cin \times VUVLOH^2$$

$$E_{Cout}[J] = \frac{1}{2}Cout \times VVOUT^2$$

A $P_{Harvester}[W]$ is a power generation capability of a harvester. An initial charging time ($T_{Initial}[s]$) is calculated by the following equation.

$$T_{Initial} = \frac{E_{Cin}}{P_{Harvester}} + \frac{E_{Cout}}{P_{Harvester} \times \eta}$$

A repeat charging time ($T_{Repeat}[s]$) is calculated by the following equation. The $T_{Repeat}[s]$ become shorter than the $T_{Initial}[s]$.

$$T_{Repeat} = \frac{dE_{Cin}}{P_{Harvester}} + \frac{dE_{Cout}}{P_{Harvester} \times \eta}$$

Additionally, waiting for a period of time after the OPGOOD signal goes high can store more energy on the capacitor Cin (Figure 12-2).

$$dE_{Cout}[J] = \frac{1}{2}Cin(V^2_{OpenCircuitVoltage} - VUVLOL^2)$$

Figure 12-2 Waiting for a period of time after the OPGOOD signal goes high
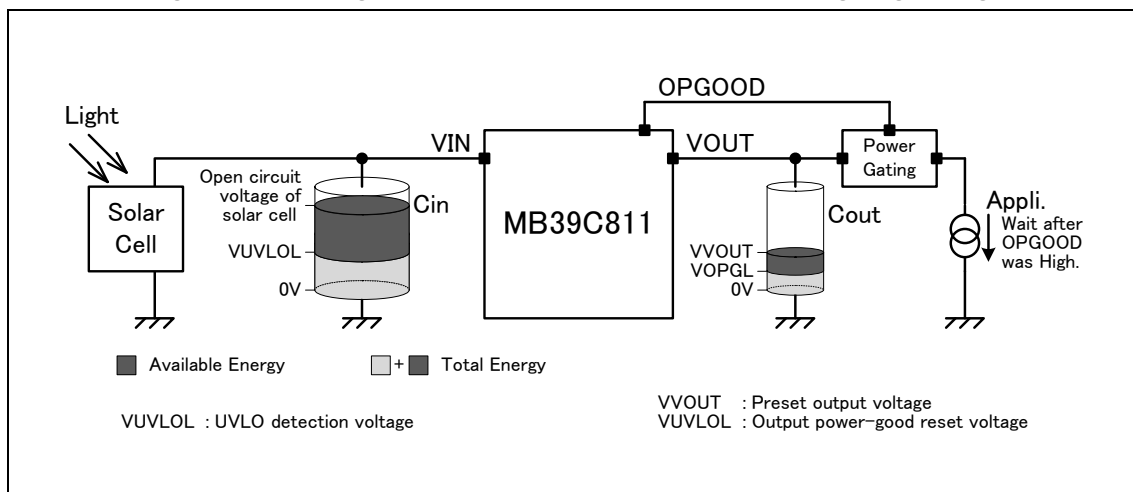

For more information about the energy calculation, refer to the APPLICATION NOTE, Energy Calculation For Energy Harvesting.

14.   Layout for Printed Circuit Board

Note the points listed below in layout design
- Place the switching parts(*1) on top layer, and avoid connecting each other through through-holes.
- Make the through-holes connecting the ground plane close to the GND pins of the switching parts(*1).
- Be very careful about the current loop consisting of the input capacitor CVIN, the VIN pin of IC, and the PGND pin. Place and connect these parts as close as possible to make the current loop small.
- The output capacitor CVOUT and the inductor L are placed adjacent to each other.
- Place the bypass capacitor CVB close to VB pin, and make the through-holes connecting the ground plane close to the GND pin of the bypass capacitor CVB.
- Draw the feedback wiring pattern from the VOUT pin to the output capacitor CVOUT pin. The wiring connected to the VOUT pin is very sensitive to noise so that the wiring should keep away from the switching parts(*1). Especially, be very careful about the leaked magnetic flux from the inductor L, even the back side of the inductor L.

*1: Switching parts: IC (MB39C811), Input capacitor (CVIN), Inductor (L), Output capacitor (CVOUT). Refer to Figure 6-1.

Figure 14-1 Example of a layout design
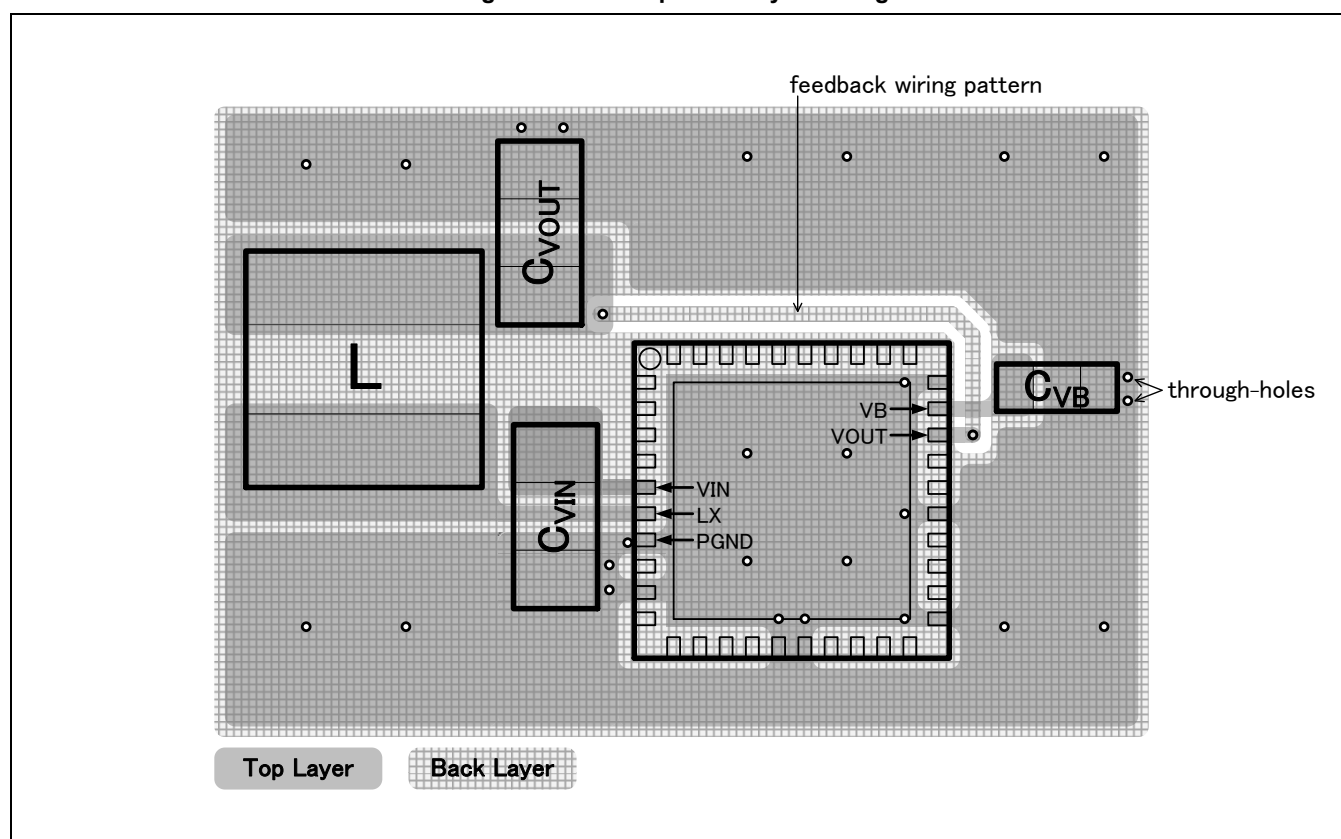

15. Usage Precaution

Do not configure the IC over the maximum ratings

If the IC is used over the maximum ratings, the LSI may be permanently damaged.

It is preferable for the device to be normally operated within the recommended usage conditions. Usage outside of these conditions can have a bad effect on the reliability of the LSI.

Use the devices within recommended operating conditions

The recommended operating conditions are the recommended values that guarantee the normal operations of LSI.

The electrical ratings are guaranteed when the device is used within the recommended operating conditions and under the conditions stated for each item.

Printed circuit board ground lines should be set up with consideration for common impedance

Take appropriate measures against static electricity

- Containers for semiconductor materials should have anti-static protection or be made of conductive material.
- After mounting, printed circuit boards should be stored and shipped in conductive bags or containers.
- Work platforms, tools, and instruments should be properly grounded.
- Working personnel should be grounded with resistance of 250 kΩ to 1MΩ in series between body and ground.

Do not apply negative voltages

The use of negative voltages below -0.3V may cause the parasitic transistor to be activated on LSI lines, which can cause malfunctions.

16. Ordering Information

19. Recommended Mounting Conditions

Table 19-1 Recommended mounting conditions

Items	Contents	
Method	IR(Infrared Reflow) / Convection	
Times	3 times in succession	
Floor life	Before unpacking	Please use within 2 years after production.
	From unpacking to reflow	Within 7 days
	In case over period of floor life(*1)	Baking with 125°C+/-3°C for 24hrs+2hrs/-0hrs is required. Then please use within 7 days. (Please remember baking is up to 2 times)
Floor life condition	Between 5°C and 30°C and also below 70%RH required. (It is preferred lower humidity in the required temp range.)	

*1: Concerning the Tape & Reel product, please transfer product to heatproof tray and so on when you perform baking. Also please prevent lead deforming and ESD damage during baking process.

Figure 19-1 Recommended mounting conditions
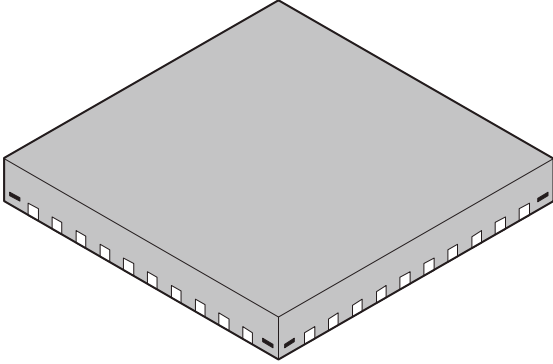

Table 19-2 Recommended mounting conditions (J-STD-020D)

(Temperature on the top of the package body is measured.)

260°C Max.	
TL to TP: Ramp Up Rate	3°C/s Max.
TS: Preheat & Soak	150 to 200°C, 60 to 120s
TP - tP: Peak Temperature	260°C Down, within 30s
TL – tL: Liquidous Temperature	217°C, 60 to 150s
TP to TL: Ramp Down Rate	6°C /s Max.
Time 25°C to Peak	8min Max.

21. Major Changes

Page	Section	Change Results
Preliminary 0.1 [June 14, 2013]		
-	-	Initial release
Revision 1.0 [November 18, 2013]		
6	4.Pin Assignments	Changed Pin8 PGND to N.C.
7	5.Pin Descriptions	Changed Pin8 PGND to N.C.
9	7.Absolute Maximum Rating	Added Max in Power dissipation
		Added Figure [Power dissipation]
		Changed VIN pin input slew rate
		Added VIN pin , Input current
		Added AC pin input current
10	8.Recommended Operating Conditions	Deleted Added VIN pin , Input current
		Deleted AC pin input current
11	9.1.DC Characteristics	Changed values in "Input voltage range"
		Deleted Input slew rate
		Added "IOUT=1mA" in "Preset output voltage" and changed values
		Changed "over current protection" to "peak switching current" and values
		Changed "Output current" to "Maximum output current" and values
		Changed values in "UVLO release voltage"
		Changed values in "UVLO detection voltage"
18	11.Example	Added new
22	14.Ordering Information	Added "Table 14-2 EVB Ordering Information"
23	15.Marking	Added new
24	16.Product Label	Added new
25	17.Recommended Mounting Conditions	Added new
Revision 2.0		
11	9. Electrical Characteristics Table 9-1 DC characteristics	Deleted Input voltage range
18	11. Typical Application Circuits Figure 11-3 Voltage doubler rectification circuit for vibration harvester	Added the explanation of the voltage doubler rectification circuit
19 to 21	12. Application Notes	Added the "12. Application Notes"
22 to 26	13. Typical Characteristics	Updated the "13. Typical Characteristics"
27	14. Layout for Printed Circuit Board	Added the "14. Layout for Printed Circuit Board"
30 to 32	18. Product Label	Changed the "18. Product Label"

Colophon

The products described in this document are designed, developed and manufactured as contemplated for general use, including without limitation, ordinary industrial use, general office use, personal use, and household use, but are not designed, developed and manufactured as contemplated (1) for any use that includes fatal risks or dangers that, unless extremely high safety is secured, could have a serious effect to the public, and could lead directly to death, personal injury, severe physical damage or other loss (i.e., nuclear reaction control in nuclear facility, aircraft flight control, air traffic control, mass transport control, medical life support system, missile launch control in weapon system), or (2) for any use where chance of failure is intolerable (i.e., submersible repeater and artificial satellite). Please note that Spansion will not be liable to you and/or any third party for any claims or damages arising in connection with above-mentioned uses of the products. Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions. If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Law of Japan, the US Export Administration Regulations or the applicable laws of any other country, the prior authorization by the respective government entity will be required for export of those products.

Trademarks and Notice

The contents of this document are subject to change without notice. This document may contain information on a Spansion product under development by Spansion. Spansion reserves the right to change or discontinue work on any product without notice. The information in this document is provided as is without warranty or guarantee of any kind as to its accuracy, completeness, operability, fitness for particular purpose, merchantability, non-infringement of third-party rights, or any other warranty, express, implied, or statutory. Spansion assumes no liability for any damages of any kind arising out of the use of the information in this document.
