

Integrated Power Hybrid IC for
Appliance Motor Drive Applications.

Description

International Rectifier's IRAMY20UP60B is a 20A, 600V Integrated Power Hybrid IC with Internal Shunt Resistor for Appliance Motor Drives applications such as air conditioning systems and compressor drivers as well as for light industrial application. IR's technology offers an extremely compact, high performance AC motor-driver in a single isolated package to simplify design.

This advanced HIC is a combination of IR's low $V_{CE(on)}$ Non Punch-Through IGBT technology and the industry benchmark 3-Phase high voltage, high speed driver in a fully isolated thermally enhanced package.

A built-in temperature monitor and over-current and over-temperature protections, along with the short-circuit rated IGBTs and integrated under-voltage lockout function, deliver high level of protection and fail-safe operation. Using a newly developed single in line package (SiP3) with heatspreader for the power die along with full transfer mold structure minimizes PCB space and resolves isolation problems to heatsink. UL certified.

Features

- Integrated Gate Drivers
- Temperature Monitor and Protection
- Overcurrent shutdown
- Fully Isolated Package
- Low $V_{CE(on)}$ Non Punch Through IGBT Technology.
- Undervoltage lockout for all channels
- Matched propagation delay for all channels
- 5V Schmitt-triggered input logic
- Cross-conduction prevention logic
- Lower di/dt gate driver for better noise immunity
- Motor Power range 0.75~2.2kW / 85~253 Vac
- Isolation 2000V_{RMS} min
- UL Certificate Number: E252584

Sequence of events:

- 1-2) Current begins to rise
- 2) Current reaches I_{BUS_Trip} level
- 2-3) Current is higher than I_{BUS_Trip} for at least $6\mu s$. This value is the worst-case condition with very low over-current. In case of high current (short circuit), the actual delay will be smaller.
- 3-4) Delay between driver identification of over-current condition and disabling of all outputs
- 4) Current starts decreasing, eventually reaching 0
- 5) Current goes below I_{BUS_trip} , the driver starts its auto-reset sequence
- 6) Driver is automatically reset and normal operation can resume (over-current condition must be removed by the time the drivers automatically resets itself)

Figure 2. I_{Trip} Timing Waveform

Note 5: The shaded area indicates that both high-side and low-side switches are off and therefore the half-bridge output voltage would be determined by the direction of current flow in the load.

Typical Application Connection IRAMY20UP60B

1. Electrolytic bus capacitors should be mounted as close to the module bus terminals as possible to reduce ringing and EMI problems. Additional high frequency ceramic capacitor mounted close to the module pins will further improve performance.
2. In order to provide good decoupling between V_{CC}-V_{SS} and V_{B1,2,3}-V_{S1,2,3} terminals, the capacitors shown connected between these terminals should be located very close to the module pins. Additional high frequency capacitors, typically 0.1µF, are strongly recommended.
3. Value of the boot-strap capacitors depends upon the switching frequency. Their selection should be made based on IR design tip DN 98-2a, application note AN-1044 or Figure 9. Bootstrap capacitor value must be selected to limit the power dissipation of the internal resistor in series with the V_{CC}. (see maximum ratings Table on page 3).
4. Current sense signal can be obtained from pin 20 and pin 22. Care should be taken to avoid having inverter current flowing through pin 22 to mantain required current measurement accuracy
5. After approx. 8ms the FAULT is reset. (see Dynamic Characteristics Table on page 5).
6. PWM generator must be disabled within Fault duration to guarantee shutdown of the system, overcurrent condition must be cleared before resuming operation.
7. Fault/Temp Monitor pin must be pulled-up to +5V.
