Pin Descriptions

Pin Number	Pin Name	Pin Type	Pin Description
1	Q4	Output	Clock Output 4.
2	VDD	Power	Connect to +1.8V, +2.5 V, or +3.3 V.
3	ICLK	Input	Clock input.
4	GND	Power	Connect to ground.
5	Q0	Output	Clock output 0.
6	Q1	Output	Clock output 1.
7	Q2	Output	Clock Output 2.
8	Q3	Output	Clock Output 3.

External Components

A minimum number of external components are required for proper operation. A decoupling capacitor of 0.01µF should be connected between VDD on pin 2 and GND on pin 4, as close to the device as possible. A 33Ω series terminating resistor may be used on each clock output if the trace is longer than 1 inch.

To achieve the low output skew that the 74FCT38075S is capable of, careful attention must be paid to board layout. Essentially, all five outputs must have identical terminations, identical loads and identical trace geometries. If they do not, the output skew will be degraded. For example, using a 30Ω series termination on one output (with 33Ω on the others) will cause at least 15 ps of skew.

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the 74FCT38075S. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.
