

Four Output Differential Buffer for PCI Express

Recommended Application:

DB800 Version 2.0 Yellow Cover part with PCI Express support with extended bypass mode frequency range.

Output Features:

- 4 - 0.7V current-mode differential output pairs
- Supports zero delay buffer mode and fanout mode
- Bandwidth programming available

Key Specifications:

- Outputs cycle-cycle jitter: < 50ps
- Outputs skew: < 50ps
- Extended frequency range in bypass mode:
Revision B: up to 333.33MHz
Revision C: up to 400MHz

Features/Benefits:

- Spread spectrum modulation tolerant, 0 to -0.5% down spread and +/- 0.25% center spread
- Supports undriven differential outputs in PD# and SRC_STOP# modes for power management.

Pin Description When OE_INV = 0

PIN #	PIN NAME	PIN TYPE	DESCRIPTION
1	VDD	PWR	Power supply, nominal 3.3V
2	SRC_IN	IN	0.7 V Differential SRC TRUE input
3	SRC_IN#	IN	0.7 V Differential SRC COMPLEMENTARY input
4	GND	PWR	Ground pin.
5	VDD	PWR	Power supply, nominal 3.3V
6	DIF_1	OUT	0.7V differential true clock output
7	DIF_1#	OUT	0.7V differential complement clock output
8	OE_1	IN	Active high input for enabling output 1. 0 = tri-state outputs, 1= enable outputs
9	DIF_2	OUT	0.7V differential true clock output
10	DIF_2#	OUT	0.7V differential complement clock output
11	VDD	PWR	Power supply, nominal 3.3V
12	BYPASS#/PLL	IN	Input to select Bypass(fan-out) or PLL (ZDB) mode 0 = Bypass mode, 1= PLL mode
13	SCLK	IN	Clock pin of SMBus circuitry, 5V tolerant.
14	SDATA	I/O	Data pin for SMBus circuitry, 5V tolerant.
15	PD#	IN	Asynchronous active low input pin used to power down the device. The internal clocks are disabled and the VCO and the crystal are stopped.
16	SRC_STOP#	IN	Active low input to stop SRC outputs.
17	HIGH_BW#	IN	3.3V input for selecting PLL Band Width 0 = High, 1= Low
18	VDD	PWR	Power supply, nominal 3.3V
19	DIF_5#	OUT	0.7V differential complement clock output
20	DIF_5	OUT	0.7V differential true clock output
21	OE_6	IN	Active high input for enabling output 6. 0 = tri-state outputs, 1= enable outputs
22	DIF_6#	OUT	0.7V differential complement clock output
23	DIF_6	OUT	0.7V differential true clock output
24	VDD	PWR	Power supply, nominal 3.3V
25	OE_INV	IN	This latched input selects the polarity of the OE pins. 0 = OE pins active high, 1 = OE pins active low (OE#)
26	IREF	OUT	This pin establishes the reference current for the differential current-mode output pairs. This pin requires a fixed precision resistor tied to ground in order to establish the appropriate current. 475 ohms is the standard value.
27	GNDA	PWR	Ground pin for the PLL core.
28	VDDA	PWR	3.3V power for the PLL core.

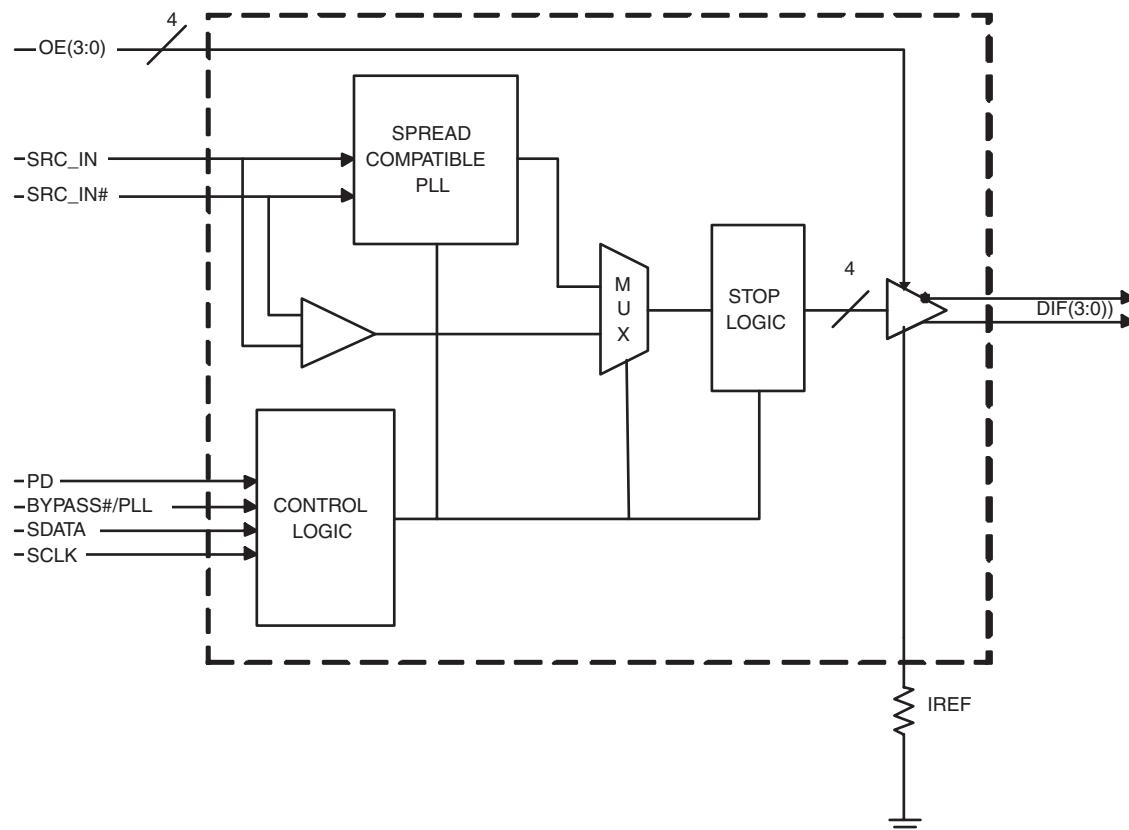

Pin Description When OE_INV = 1

PIN #	PIN NAME	PIN TYPE	DESCRIPTION
1	VDD	PWR	Power supply, nominal 3.3V
2	SRC_IN	IN	0.7 V Differential SRC TRUE input
3	SRC_IN#	IN	0.7 V Differential SRC COMPLEMENTARY input
4	GND	PWR	Ground pin.
5	VDD	PWR	Power supply, nominal 3.3V
6	DIF_1	OUT	0.7V differential true clock output
7	DIF_1#	OUT	0.7V differential complement clock output
8	OE1#	IN	Active low input for enabling DIF pair 1. 1 = tri-state outputs, 0 = enable outputs
9	DIF_2	OUT	0.7V differential true clock output
10	DIF_2#	OUT	0.7V differential complement clock output
11	VDD	PWR	Power supply, nominal 3.3V
12	BYPASS#/PLL	IN	Input to select Bypass(fan-out) or PLL (ZDB) mode 0 = Bypass mode, 1= PLL mode
13	SCLK	IN	Clock pin of SMBus circuitry, 5V tolerant.
14	SDATA	I/O	Data pin for SMBus circuitry, 5V tolerant.
15	PD	IN	Asynchronous active high input pin used to power down the device. The internal clocks are disabled and the VCO is stopped.
16	SRC_STOP	IN	Active high input to stop SRC outputs.
17	HIGH_BW#	IN	3.3V input for selecting PLL Band Width 0 = High, 1= Low
18	VDD	PWR	Power supply, nominal 3.3V
19	DIF_5#	OUT	0.7V differential complement clock output
20	DIF_5	OUT	0.7V differential true clock output
21	OE6#	IN	Active low input for enabling DIF pair 6. 1 = tri-state outputs, 0 = enable outputs
22	DIF_6#	OUT	0.7V differential complement clock output
23	DIF_6	OUT	0.7V differential true clock output
24	VDD	PWR	Power supply, nominal 3.3V
25	OE_INV	IN	This latched input selects the polarity of the OE pins. 0 = OE pins active high, 1 = OE pins active low (OE#)
26	IREF	OUT	This pin establishes the reference current for the differential current-mode output pairs. This pin requires a fixed precision resistor tied to ground in order to establish the appropriate current. 475 ohms is the standard value.
27	GNDA	PWR	Ground pin for the PLL core.
28	VDDA	PWR	3.3V power for the PLL core.

General Description

The **ICS9DB401** follows the Intel DB400 Differential Buffer Specification v2.0. This buffer provides four PCI-Express SRC clocks. The **ICS9DB401** is driven by a differential input pair from a CK409/CK410/CK410M main clock generator, such as the ICS952601, ICS954101 or ICS954201. It provides outputs meeting tight cycle-to-cycle jitter (50ps) and output-to-output skew (50ps) requirements.

Block Diagram

Note: Polarities shown for OE_INV = 0.

General SMBus serial interface information for the ICS9DB401

How to Write:

- Controller (host) sends a start bit.
- Controller (host) sends the write address DC_(H)
- ICS clock will **acknowledge**
- Controller (host) sends the begining byte location = N
- ICS clock will **acknowledge**
- Controller (host) sends the data byte count = X
- ICS clock will **acknowledge**
- Controller (host) starts sending **Byte N through Byte N + X - 1**
(see Note 2)
- ICS clock will **acknowledge** each byte **one at a time**
- Controller (host) sends a Stop bit

How to Read:

- Controller (host) will send start bit.
- Controller (host) sends the write address DC_(H)
- ICS clock will **acknowledge**
- Controller (host) sends the begining byte location = N
- ICS clock will **acknowledge**
- Controller (host) will send a separate start bit.
- Controller (host) sends the read address DD_(H)
- ICS clock will **acknowledge**
- ICS clock will send the data byte count = X
- ICS clock sends **Byte N + X - 1**
- ICS clock sends **Byte 0 through byte X (if X_(H) was written to byte 8)**.
- Controller (host) will need to acknowledge each byte
- Controller (host) will send a not acknowledge bit
- Controller (host) will send a stop bit

PD#

The PD# pin cleanly shuts off all clocks and places the device into a power saving mode. PD# must be asserted before shutting off the input clock or power to insure an orderly shutdown. PD is asynchronous active-low input for both powering down the device and powering up the device. When PD# is asserted, all clocks will be driven high, or tri-stated (depending on the PD# drive mode and Output control bits) before the PLL is shut down.

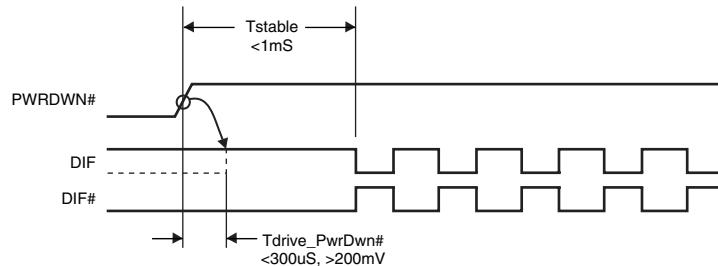

PD# Assertion

When PD# is sampled low by two consecutive rising edges of DIF#, all DIF outputs must be held High, or tri-stated (depending on the PD# drive mode and Output control bits) on the next High-Low transition of the DIF# outputs. When the PD# drive mode bit is set to '0', all clock outputs will be held with DIF driven High with $2 \times I_{REF}$ and DIF# tri-stated. If the PD# drive mode bit is set to '1', both DIF and DIF# are tri-stated.

PD# De-assertion

Power-up latency is less than 1 ms. This is the time from de-assertion of the PD# pin, or VDD reaching 3.3V, or the time from valid SRC_IN clocks until the time that stable clocks are output from the device (PLL Locked). If the PD# drive mode bit is set to '1', all the DIF outputs must driven to a voltage of >200 mV within 300 ms of PD# de-assertion.

Note: Polarities in timing diagrams are shown OE INV 0. They are similar to OE INV 1.

SRC_STOP#

The SRC_STOP# signal is an active-low asynchronous input that cleanly stops and starts the DIF outputs. A valid clock must be present on SRC_IN for this input to work properly. The SRC_STOP# signal is de-bounced and must remain stable for two consecutive rising edges of DIF# to be recognized as a valid assertion or de-assertion.

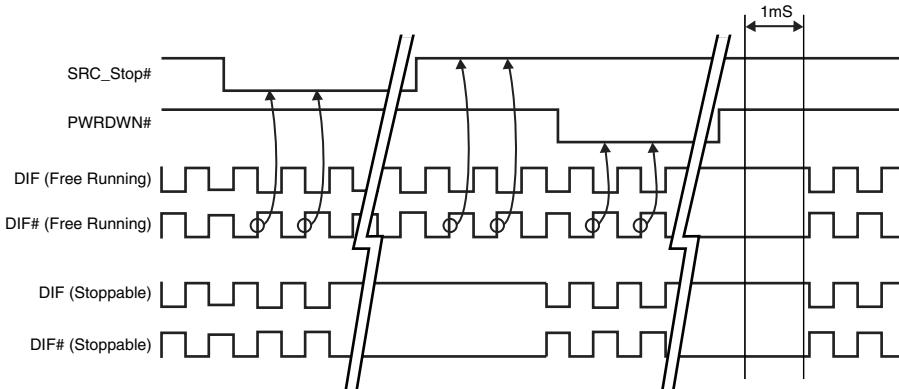

SRC_STOP# - Assertion (transition from '1' to '0')

Asserting SRC_STOP# causes all DIF outputs to stop after their next transition (if the control register settings allow the output to stop). When the SRC_STOP# drive bit is '0', the final state of all stopped DIF outputs is DIF = High and DIF# = Low. There is no change in output drive current. DIF is driven with $6 \times I_{REF}$. DIF# is not driven, but pulled low by the termination. When the SRC_STOP# drive bit is '1', the final state of all DIF output pins is Low. Both DIF and DIF# are not driven.

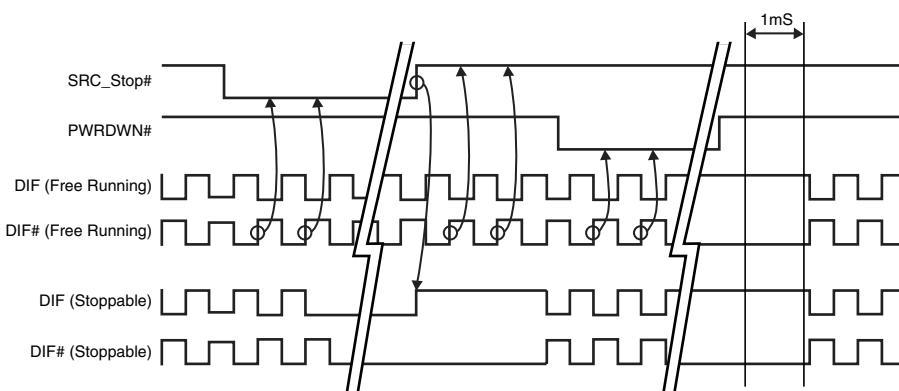

SRC_STOP# - De-assertion (transition from '0' to '1')

All stopped differential outputs resume normal operation in a glitch-free manner. The de-assertion latency to active outputs is 2-6 DIF clock periods, with all DIF outputs resuming simultaneously. If the SRC_STOP# drive control bit is '1' (tri-state), all stopped DIF outputs must be driven High (>200 mV) within 10 ns of de-assertion.

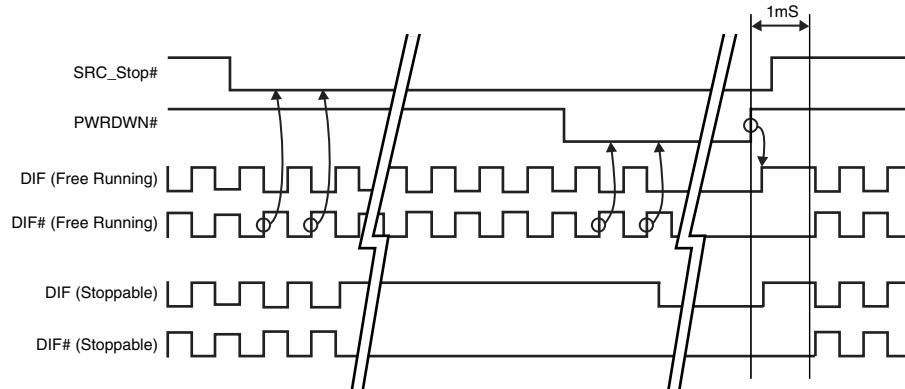

SRC_STOP_1 (SRC_Stop = Driven, PD = Driven)

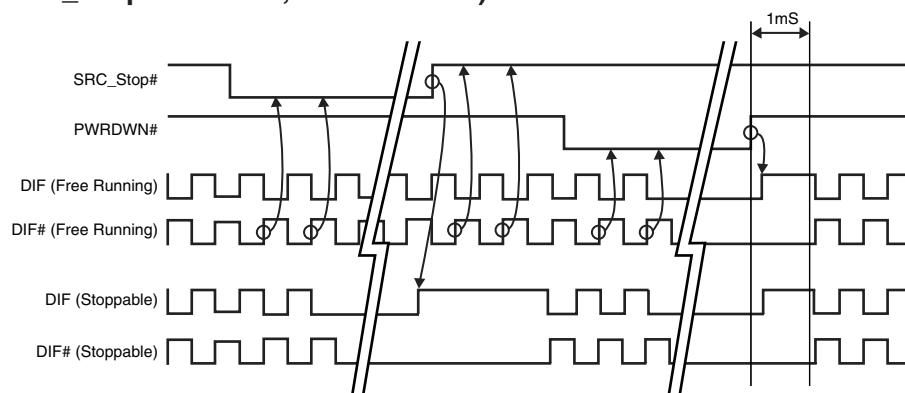

SRC_STOP_2 (SRC_Stop = Tristate, PD = Driven)

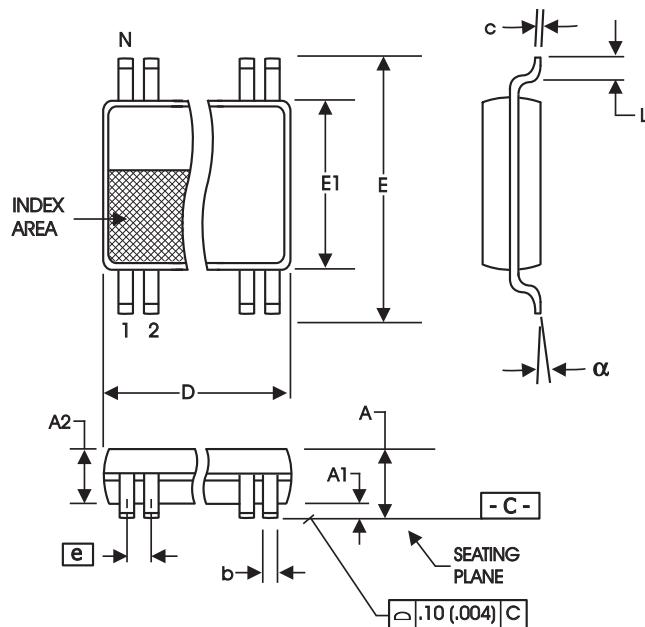

SRC_STOP_3 (SRC_Stop = Driven, PD = Tristate)

SRC_STOP_4 (SRC_Stop = Tristate, PD = Tristate)

9DB401 (Clock Buffers)

Description

Four Output Differential Buffer for PCI Express. DB800 Version 2.0 Yellow Cover part with PCI Express Support with extended bypass mode frequency range.

Market Group

PC CLOCK

Additional Info

The ICS9DB401 follows the Intel DB400 Differential Buffer Specification v2.0. This buffer provides four PCI-Express SRC clocks. The ICS9DB401 is driven by a differential input pair from a CK409/CK410/CK410M main clock generator, such as the ICS952601, ICS954101 or ICS954201. It provides outputs meeting tight cycle-to-cycle jitter (50ps) and output-to-output skew (50ps) requirements. 28-pin SSOP/TSSOP
