

## **Triple Output, Low-Noise LDO Regulator with Integrated Reset Circuit**

The ISL6414 is an ultra low noise triple output LDO regulator with microprocessor reset circuit and is optimized for powering wireless chip sets. The IC accepts an input voltage range of 3.0V to 3.6V and provides three regulated output voltages: 1.8V (LDO1), 2.84V (LDO2), and another ultra clean 2.84V (LDO3). On chip logic provides sequencing between LDO1 and LDO2 for BBP/MAC and I/O supply voltage outputs. LDO3 features ultra low noise that does not typically exceed 30 $\mu$ V RMS to aid VCO stability. High integration and the thin Quad Flat No-lead (QFN) package makes ISL6414 an ideal choice to power many of today's small form factor industry standard wireless cards, such as PCMCIA, mini-PCI and Cardbus-32.

The ISL6414 uses an internal PMOS transistor as the pass device. The SHDN pin controls LDO1 and LDO2 outputs whereas SHDN3 controls LDO3 output. Internal voltage sequencing insures that LDO1 output (1.8V supply) is always stabilized before LDO2 is turned on. When powering down, power to the LDO2 is removed before the LDO1 output goes off. The ISL6414 also integrates RESET function, which eliminates the need for additional RESET IC required in WLAN applications. The IC asserts a RESET signal whenever the  $V_{IN}$  supply voltage drops below a preset threshold, keeping it asserted for at least 25ms after  $V_{IN}$  has risen above the reset threshold. An output fault detection circuit indicates loss of regulation on LDO1. Other features include an overcurrent protection, thermal shutdown and reverse battery protection.

## **Ordering Information**

<b>PART NUMBER</b>	<b>TEMP. RANGE (°C)</b>	<b>PACKAGE</b>	<b>PKG. DWG. #</b>
ISL6414IR	-40 to +85	16 Ld QFN	L16.4x4
ISL6414IR-T5K		16 Ld QFN Tape and Reel	L16.4x4
ISL6414IR-TK		16 Ld QFN Tape and Reel	L16.4x4
ISL6414IRZ (Note)	-40 to +85	16 Ld QFN (Pb-free)	L16.4x4
ISL6414IRZ-TK (Note)		16 Ld QFN Tape and Reel (Pb-free)	L16.4x4

NOTE: Intersil Pb-free plus anneal products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

## **Features**

- Small DC/DC Converter Size
  - Three LDOs and RESET Circuitry in a Low-Profile 4x4mm QFN Package
- High Output Current
  - LDO1, 1.8V . . . . . 500mA
  - LDO2, 2.84V . . . . . 300mA
  - LDO3, 2.84V . . . . . 200mA
- Ultra-Low Dropout Voltage
  - LDO2, 2.84V . . . . . 125mV (typ.) at 300mA
  - LDO3, 2.84V . . . . . 100mV (typ.) at 200mA
- Ultra-Low Output Voltage Noise
  - <30 $\mu$ V<sub>RMS</sub> (typ.) for LDO3 (VCO Supply)
- Stable with Smaller Ceramic Output Capacitors
- Voltage Sequencing for BBP/MAC and Analog Supplies
- Extensive Protection and Monitoring Features
  - Overcurrent and short circuit protection
  - Thermal shutdown
  - Reverse battery protection
  - FAULT indicator
- Logic-Controlled Dual Shutdown Pins
- Integrated Microprocessor Reset Circuit
  - Programmable Reset Delay
  - Complimentary Reset Outputs
- Proven Reference Design for Total WLAN System Solution
- QFN Package Option
  - Compliant to JEDEC PUB95 MO-220 QFN - Quad Flat No Leads - Product Outline
  - Near Chip-Scale Package Footprint Improves PCB Efficiency and Is Thinner in Profile
- Pb-Free Plus Anneal Available (RoHS Compliant)

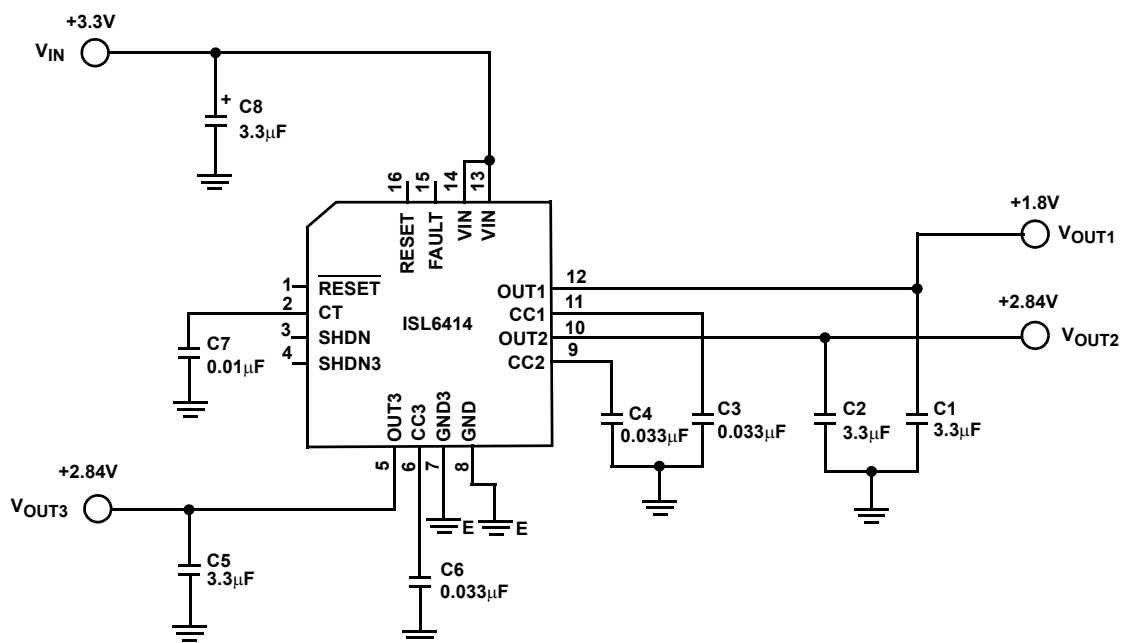

## **Applications**

- PRISM® 3, PRISM GT™, and PRISM WWR Chipsets
- WLAN Cards
  - PCMCIA, Cardbus32, MiniPCI Cards
  - Compact Flash Cards
- Hand-Held Instruments

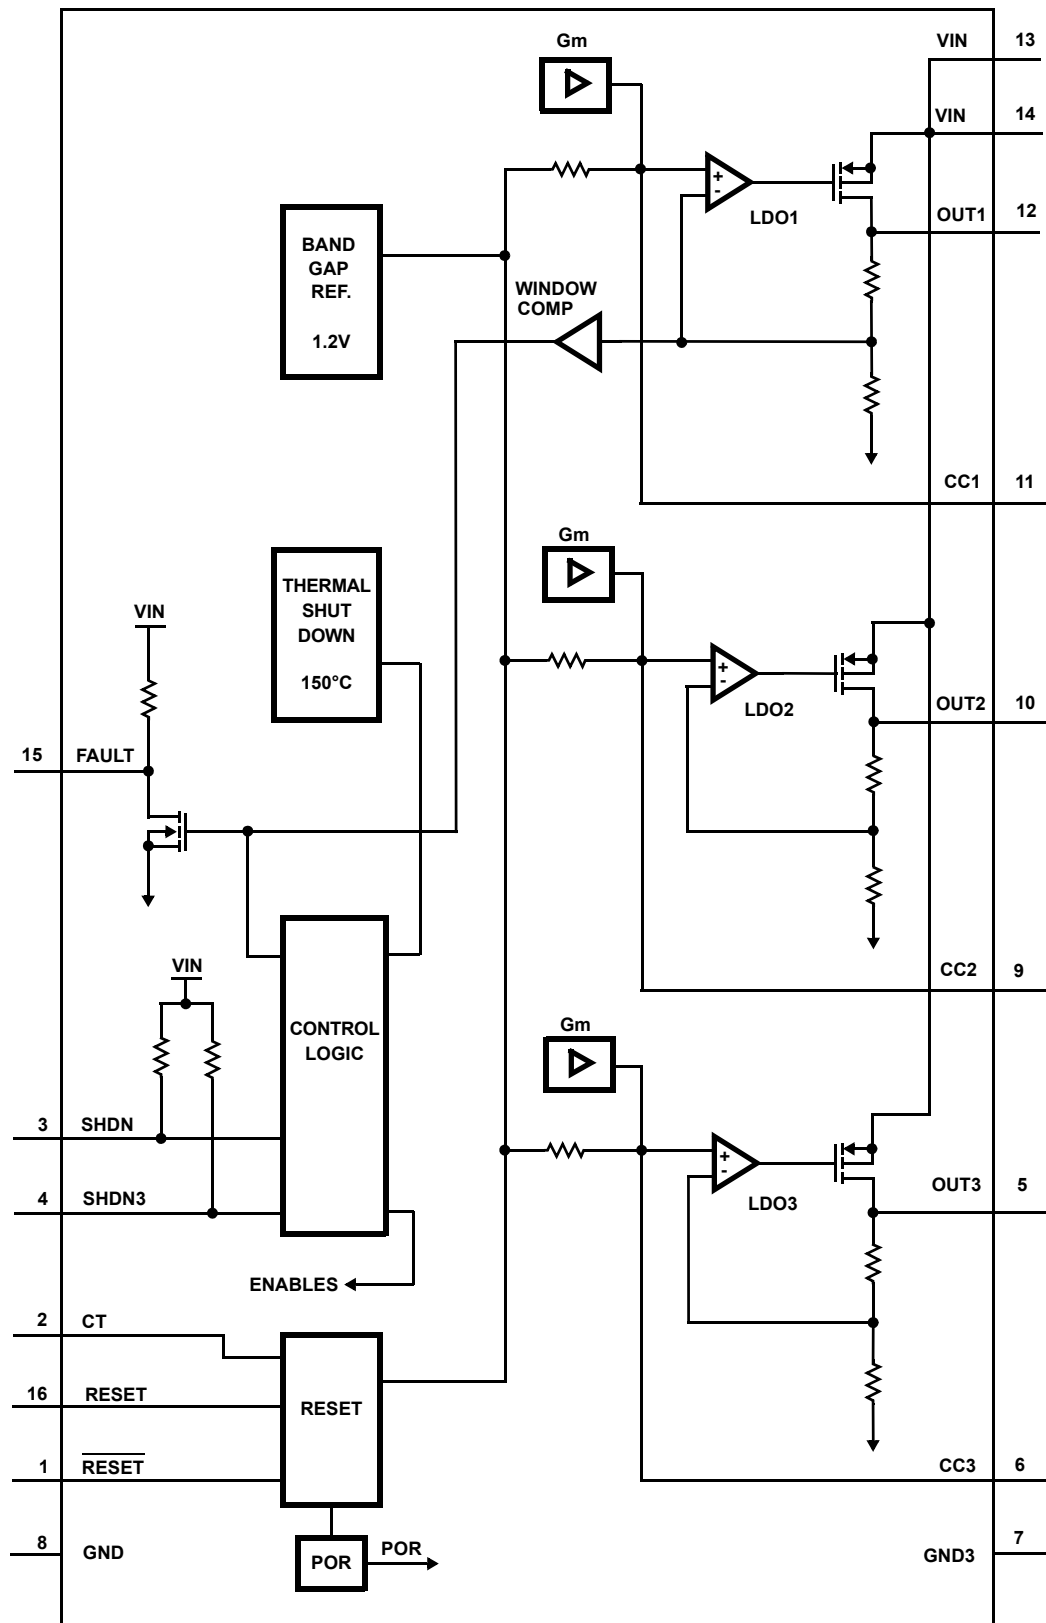

## Pinout

## Typical Application Schematic

# Functional Block Diagram

**Absolute Maximum Ratings** (Note 1)

$V_{IN}$ , SHDN/SHDN3 to GND/GND3	-7.0V to 7.0V
SET, CC, FAULT to GND/GND3	-0.3V to 7.0V
Output Current (Continuous)	
LDO1	500mA
LDO2	300mA
LDO3	200mA
ESD Classification	Class 1

**Thermal Information**

Thermal Resistance (Typical Notes 2, 3)	$\theta_{JA}$ (°C/W)	$\theta_{JC}$ (°C/W)
QFN Package	46	8.0
Maximum Junction Temperature (Plastic Package)	-55°C to 150°C	
Maximum Storage Temperature Range	-65°C to 150°C	
Maximum Lead Temperature (Soldering 10s)	300°C	
Operating Temperature Range	-40°C to 85°C	

**CAUTION:** Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

**NOTES:**

1. All voltages are with respect to GND.
2.  $\theta_{JA}$  is measured in free air with the component mounted on a high effective thermal conductivity test board with "direct attach" features. See Tech Brief TB379.
3. For  $\theta_{JC}$ , the "case temp" location is the center of the exposed metal pad on the package underside. See Tech Brief TB379.

**Electrical Specifications**  $V_{IN} = +3.3V$ , Compensation Capacitor = 33nF,  $T_A = 25^\circ C$ , Unless Otherwise Noted.

<b>FAULT</b>					
Rising Threshold	% of $V_{OUT}$	5.0	5.5	6.0	%
Falling Threshold	% of $V_{OUT}$	-5.0	-5.5	-5.0	%

**NOTES:**

- Specifications at  $-40^\circ C$  are guaranteed by design/characterization, not production tested.
- The dropout voltage is defines as  $V_{IN} - V_{OUT}$ , when  $V_{OUT}$  is 50mV below the value of  $V_{OUT}$  for  $V_{IN} = V_{OUT} + 0.5V$ .
- The RESET time is linear with CT at a slope of 2.5ms/nF. Thus, at 10nF (0.01 $\mu F$ ) the RESET time is 25ms; at 100nF (0.1 $\mu F$ ) the RESET time would be 250ms.
- Guaranteed by design, not production tested.
- LDO1 is guaranteed by design to be within regulation at 2.7V minimum input voltage.

## Pin Descriptions

**OUT1** - This pin is the output for LDO1. Bypass with a minimum of 2.2 $\mu$ F, low ESR capacitor to GND for stable operation.

**V<sub>IN</sub>** - Supply input pins. Connect to input power source. Bypass with 2.2 $\mu$ F capacitor to GND. Both V<sub>IN</sub> pins must be tied together on the PC board, close to the IC.

**GND** - Ground pin for LDO1 and LDO2.

**CC1** - Compensation Capacitor for LDO1. Connect a 0.033 $\mu$ F capacitor from CC1 to GND.

**SHDN** - Shutdown input for LDO1 and LDO2. Connect to IN for normal operation. Drive SHDN pin LOW to turn off LDO1 and LDO2.

**OUT2** - This pin is the output for LDO2. Bypass with a minimum of 2.2 $\mu$ F, low ESR capacitor to GND for stable operation.

**CT** - Timing pin for the RESET circuit pulse width.

**CC2** - Compensation capacitor for LDO2. Connect a 0.033 $\mu$ F capacitor from CC2 to GND.

**OUT3** - This pin is output for LDO3. Bypass with a minimum of 2.2 $\mu$ F, low ESR capacitor to GND3 for stable operation.

**GND3** - Ground pin for LDO3.

**CC3** - Compensation capacitor for LDO3. Connect a 0.033 $\mu$ F capacitor from CC3 to GND3.

**SHDN3** - Shutdown input for LDO3. Connect to V<sub>IN</sub> for normal operation. Drive SHDN3 pin LOW to turn off LDO3.

**FAULT** - This is the power good indicator for LDO1. When the 1.8V output is out of regulation ( $>\pm 5\%$ , typ.), this pin goes LOW. This pin also goes LOW during thermal shutdown and any overcurrent event on LDO1. Connect this pin to GND, if unused. This pin remains HIGH in the shutdown mode, as controlled by the SHDN pin (refer to Figure 19).

**RESET** - This pin is the active-LOW output of the push-pull output stage of the integrated reset supervisory circuit. The reset circuit monitors V<sub>IN</sub> and asserts a  $\overline{\text{RESET}}$  output at this pin, if V<sub>IN</sub> falls below the RESET threshold. The  $\overline{\text{RESET}}$  output remains LOW, while the V<sub>IN</sub> pin voltage is below the reset threshold, and for at least 25ms, after V<sub>IN</sub> rises above the RESET threshold.

**RESET** - This pin is the active-HIGH output of the push-pull output stage of the integrated reset supervisory circuit. The reset circuit monitors V<sub>IN</sub> and asserts a RESET output at this pin, if V<sub>IN</sub> falls below the RESET threshold. The RESET output remains HIGH, while the V<sub>IN</sub> pin voltage is below the RESET threshold, and for at least 25ms, after V<sub>IN</sub> rises above the RESET threshold.

## Functional Description

The ISL6414 is a 3-in-1 multi-output, low dropout, regulator designed for wireless chipset power applications. It supplies three fixed output voltages 1.8V, 2.84V and 2.84V. The 1.8V output from LDO1 remains active down to a V<sub>IN</sub> = 2.7V (min.), ensuring proper BBP/MAC operation. Each LDO consists of a 1.2V reference, error amplifier, MOSFET driver, P-Channel pass transistor, dual-mode comparator and internal feedback voltage divider.

The 1.2V band gap reference is connected to the error amplifier's inverting input. The error amplifier compares this reference to the selected feedback voltage and amplifies the difference. The MOSFET driver reads the error signal and applies the appropriate drive to the P-Channel pass transistor. If the feedback voltage is lower than the reference voltage, the pass transistor gate is pulled lower, allowing more current to pass and increasing the output voltage. If the feedback voltage is higher than the reference voltage, the pass transistor gate is driven higher, allowing less current to pass to the output. The output voltage is fed back through an internal resistor divider connected to OUT1/2/3 pins.

Additional blocks include an output overcurrent protection, reverse battery protection, thermal sensor, fault detector, RESET function and shutdown logic.

### Internal P-Channel Pass Transistors

The ISL6414 features a typical 0.5 $\Omega$  r<sub>DS(ON)</sub> P-channel MOSFET pass transistors. This provides several advantages over similar designs using PNP bipolar pass transistors. The P-Channel MOSFET requires no base drive, which reduces quiescent current considerably. PNP based regulators waste considerable current in dropout when the pass transistor saturates. They also use high base drive currents under large loads. The ISL6414 does not suffer from these problems.

### Integrated RESET for MAC/ Baseband Processors

The ISL6414 includes a microprocessor supervisory block. This block eliminates the extra RESET IC and external components needed in wireless chipset applications. This block performs a single function; it asserts a RESET signal whenever the V<sub>IN</sub> supply voltage decreases below a preset threshold, keeping it asserted for a programmable time (set by external capacitor CT) after the V<sub>IN</sub> pin voltage has risen above the RESET threshold.

The push pull output stage of the reset circuit provides both an active-Low and an active-HIGH output. This function is guaranteed to be in the correct state for V<sub>IN</sub> down to 1V. The reset comparator is designed to ignore transients on the V<sub>IN</sub> pin. The RESET threshold for ISL6414 is 2.63V typical.

In addition to issuing a reset to the microprocessor during power-up, power down and brownout conditions, this block is relatively immune to short duration, negative-going V<sub>IN</sub> transients/glitches.

## Output Voltages

The ISL6414 provides fixed output voltages for use in Wireless Chipset applications. Internal trimmed resistor networks set the typical output voltages as shown here:

$$V_{OUT1} = 1.8V; V_{OUT2} = 2.84V; V_{OUT3} = 2.84V.$$

## Shutdown

Driving the SHDN input LOW puts both LDO1 and LDO2 in shutdown mode. Driving the SHDN3 input LOW puts LDO3 in shutdown mode. Pulling the SHDN and SHDN3 pins LOW simultaneously, puts the complete chip into shutdown mode, and supply current drops to 5 $\mu$ A typical. Both SHDN and SHDN3 inputs have internal pull-up resistors, so that in normal operation the outputs are always enabled; external pull-up resistors are not required. During shutdown mode using the SHDN pin, the FAULT output will remain HIGH (refer to Figure 19).

## Current Limit

The ISL6414 monitors and controls the pass transistor's gate voltage to limit the output current. The current limit for LDO1 is 550mA, LDO2 is 330mA and LDO3 is 250mA. The output can be shorted to ground without damaging the part due to the current limit and thermal protection features.

## Thermal Overload Protection

Thermal overload protection limits total power dissipation in the ISL6414. When the junction temperature ( $T_J$ ) exceeds +150°C, the thermal sensor sends a signal to the shutdown logic, turning off the pass transistor and allowing the IC to cool. The pass transistor turns on again after the IC's junction temperature typically cools by 20°C, resulting in a pulsed output during continuous thermal overload conditions. Thermal overload protection protects the ISL6414 against fault conditions. For continuous operation, do not exceed the absolute maximum junction temperature rating of +150°C.

## Operating Region and Power Dissipation

The maximum power dissipation of ISL6414 depends on the thermal resistance of the IC package and circuit board, the temperature difference between the die junction and ambient air, and the rate of air flow. The power dissipated in the device is:

$$P_T = P_1 + P_2 + P_3, \text{ where}$$

$$P_1 = I_{OUT1} (V_{IN} - V_{OUT1})$$

$$P_2 = I_{OUT2} (V_{IN} - V_{OUT2})$$

$$P_3 = I_{OUT3} (V_{IN} - V_{OUT3})$$

The maximum power dissipation is:

$$P_{max} = (T_{JMAX} - T_A) / \theta_{JA}$$

Where  $T_{JMAX}$  = 150°C,  $T_A$  = ambient temperature, and  $\theta_{JA}$  is the thermal resistance from the junction to the surrounding environment.

The ISL6414 package features an exposed thermal pad on its underside. This pad lowers the thermal resistance of the package by providing a direct heat conduction path from the die to the PC board. Additionally, the ISL6414's ground (GND/GND3) performs the dual function of providing an electrical connection to system ground and channeling heat away. Connect the exposed backside pad and GND to the system ground using a large pad or ground plane, or through multiple vias to the ground plane layer.

## Reverse Input Protection

The ISL6414 has a unique protection scheme that limits the reverse supply current to less than 1mA when  $V_{IN}$  falls below GND. The circuitry monitors the polarity of these two pins, disconnecting the internal circuitry and parasitic diodes when the applied voltage is reversed. This feature prevents the device from overheating and damaging an improperly installed input supply.

## Integrator Circuitry

The ISL6414 uses an external 33nF compensation capacitor for minimizing load and line regulation errors and for lowering output noise. When the output voltage shifts due to varying load current or input voltage, the integrator capacitor voltage is raised or lowered to compensate for the systematic offset at the error amplifier. Compensation is limited to  $\pm 5\%$  to minimize transient overshoot when the device goes out of dropout, current limit, or thermal shutdown.

## Fault-Detection Circuitry

The FAULT pin monitors LDO1 output regulation, as well as fault conditions such as current limit and thermal shutdown. The FAULT output goes LOW, if the LDO1 output is out of regulation by  $\pm 5.5\%$  (typ.). During shutdown mode using the SHDN pin, the FAULT output will remain HIGH (refer to Figure 19).

## Applications Information

### Capacitor Selection and Regulator Stability

Capacitors are required at the ISL6414's input and output for stable operation over the entire load range and the full temperature range. Use >1 $\mu$ F capacitor at the input of ISL6414. The input capacitor lowers the source impedance of the input supply. Larger capacitor values and lower ESR provides better PSRR and line transient response. The input capacitor must be located at a distance of not more than 0.5 inches from the  $V_{IN}$  pins of the IC and returned to a clean analog ground. Any good quality ceramic or tantalum can be used as an input capacitor.

The output capacitor must meet the requirements of minimum amount of capacitance and ESR for all three LDO's. The ISL6414 is specifically designed to work with small ceramic output capacitors. The output capacitor's ESR affects stability and output noise. Use an output capacitor with an ESR of

50m $\Omega$  or less to insure stability and optimum transient response. For stable operation, a ceramic capacitor whose value is minimum 3.3 $\mu$ F is recommended for V<sub>OUT1</sub> for 300mA output current and 2.2 $\mu$ F is recommended for V<sub>OUT2</sub> and V<sub>OUT3</sub> each at 200mA load current. There is no upper limit to the output capacitor value. Larger capacitor can reduce noise and improve load transient response, stability and PSRR. The output capacitor should be located very close to V<sub>OUT</sub> pins to minimize impact of PC board inductances and should be returned to a clean analog ground.

***Input-Output (Dropout) Voltage***

A regulator's minimum input-output voltage differential (or dropout voltage) determines the lowest usable supply voltage. In battery-powered systems, this determines the useful end-of-life battery voltage. Because the ISL6414 uses a P-channel MOSFET pass transistor, its dropout voltage is a function of r<sub>DS(ON)</sub> (typically 0.5) multiplied by the load current.

***Noise, PSSR and Transient Response***

The ISL6414 is designed to operate with low dropout voltages and low quiescent current while still maintaining good noise, transient response, and AC rejection. When operating from noisy sources, improved supply-noise rejection and transient response can be achieved by increasing the values of the input and output bypass capacitors and through passive filtering techniques.

The ISL6414 load transient response graph is presented in application note AN1080. Increasing the output capacitor value and decreasing the ESR attenuates the overshoot.
