

## Dual Input Lithium Ion Battery Charger with OVP USB Bypass and 10mA LDO

The ISL9221 Lithium Ion charging IC is designed to meet the charging requirements of most of today's handheld devices. The IC provides two inputs for either USB connection where the current is limited by the USB standard or for powering/charging from a power adapter.

If the voltage at either VUSB or VDC pin is within the safe allowable range, the PPR pin is pulled low indicating to the system processor that external power is available.

Charging can be enabled/disabled by controlling the state of the EN pin. While charging, the CHG pin is pulled low indicating the battery is being charged.

The battery is charged to 4.2V with only a 1% error across the temperature range. USB charge current, Adapter charge current and charge termination currents can be programmed via external resistors.

The ISL9221 adds an additional feature in providing a limited amount of current to system architecture while protecting the system from destructively high voltage.

The device contains Thermal regulation and protection to provide additional safety features of this device. When the temperature exceeds +125°C, the current will fold back to reduce and control the die temperature.

## Ordering Information

PART NUMBER (Note)	PART MARKING	TEMP. RANGE (°C)	PACKAGE (Pb-Free)	PKG. DWG. #
ISL9221IRZ	9221	-40°C to +85°C	12 Ld 4x3 DFN	L12.4x3
ISL9221IRZ-T*	9221	-40°C to +85°C	12 Ld 4x3 DFN	L12.4x3

\*Please refer to TB347 for details on reel specifications.

NOTE: These Intersil Pb-free plastic packaged products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate PLUS ANNEAL - e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

## Features

- Lithium Ion/Polymer battery charging
- Dual input - USB host or car/wall adapter
- Input voltage withstanding up to 28V
- 5.4V overvoltage protection on VUSB inputs
- Charging current up to 1.2A
- 4.9V/10mA linear regulator with input OVP
- Current limit on bypass path
- Programmable end-of-charge current
- Programmable charging current
- Programmable USB current limit
- Charging and power present indicator pins
- Charge enable pin
- Reverse current protection
- Pb-free (RoHS compliant)

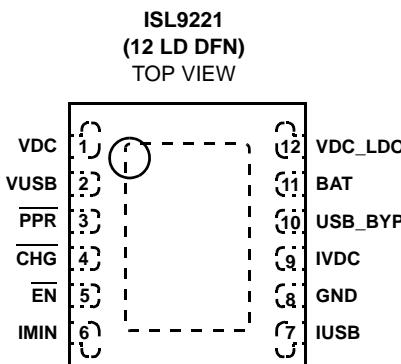

## Applications

- Smart Handheld Devices
- Cell Phones, PDAs, MP3 Players
- Digital Still Cameras
- Handheld Test Equipment

## Pinout

**Absolute Maximum Ratings**

Supply Voltage (V <sub>DC</sub> , V <sub>USB</sub> )	.....	-0.3V to 28V
Other Input Voltage (EN, I <sub>MIN</sub> , I <sub>USB</sub> , IV <sub>DC</sub> )	.....	-0.3V to 7V
Open Drain Pull Voltage (PPR, CHG)	.....	-0.3V to 7V
Other Pin Voltage(VDC_LDO, USB_BYP, VBAT)	.....	-0.3V to 7V

**Recommended Operating Conditions**

Ambient Temperature Range	.....	-40°C to +85°C
Supply Voltage (V <sub>USB</sub> )	.....	4.5V to 5.3V
Supply Voltage (V <sub>DC</sub> )	.....	4.5V to 6.7V
Typical Adapter Charge Current	.....	100mA to 1.2A
Typical USB Charge Current	.....	46.5mA to 465mA
Typical USB Bypass Current	.....	0mA to 200mA
Typical LDO Current	.....	0mA to 10mA

**CAUTION:** Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

## NOTES:

1.  $\theta_{JA}$  is measured in free air with the component mounted on a high effective thermal conductivity test board with "direct attach" features. See Tech Brief TB379.
2. For  $\theta_{JC}$ , the "case temp" location is the center of the exposed metal pad on the package underside.
3. Parts are 100% tested at +25°C. Temperature limits established by characterization and are not production tested.

**Electrical Specifications**

Typical Values are tested at USB = VDC = 5V and ambient temperature at +25°C, unless otherwise noted. All maximum and minimum values are guaranteed under the recommended operating conditions.

PARAMETERS	SYMBOL	CONDITIONS	MIN (Note 3)	TYP	MAX (Note 3)	UNITS

I	Input Pin
O	Output Pin
OD	Open-Drain
G	Ground

## Functional Pin Descriptions

### VDC

Adapter input pin. This pin is usually connected to adapter power. The maximum input voltage is 28V. The charge current from this pin is programmable up to 1.2A by selection of the resistor on the IVDC pin. When this pin is connected to a power source, no charge current is drawn from the USB pin. A 1 $\mu$ F or larger value ceramic capacitor is recommended for decoupling.

### VDC\_LDO

Linear regulator output. A 0.1 $\mu$ F to 1 $\mu$ F ceramic capacitor from this pin to ground is required.

### USB\_BYP

USB input bypass pin. This is an output from the low current bypass FET connected to the USB input pin. The USB\_BYP can be connected to the system to provide safe, voltage-limited power from the USB input pin.

### VUSB

VUSB Input pin. This pin is usually connected to a USB port power connector. The maximum input voltage is 28V. However, the internal OVP circuitry will trip at 5.4V.

The maximum current drawn from the VUSB pin is the combination of the load at USB\_BYP and the programmed USB charging current.

A 1 $\mu$ F bypass capacitor is recommended on the VUSB pin. Higher values of bypass capacitance can be utilized but the designer should refer to the maximum allowed bus capacitance per USB application standard. When using ceramic capacitors, a small resistance value, such as 1 $\Omega$  in series with the capacitor, is recommended to reduce voltage overshoot.

### IVDC

Adapter charging current setting pin. A resistor on this pin sets the maximum charging current to be delivered to the BAT pin. The maximum current, however, may be reduced by the adapter's current limit or by the power dissipation within the charging IC.

### IUSB

USB charge current pin. This pin is connected internally to a current source for setting the programmed charging current delivered to the BAT pin.

### BAT

Charger IC output pin. This pin is to be connected to the positive (+) terminal of the battery. The charging IC monitors this pin to determine the charge state of the battery.

A 1 $\mu$ F bypass capacitor from the BAT pin to ground is recommended. The charging IC relies on the battery to help stabilize the circuitry and it is not recommended to operate the charger IC without a battery connected to this pin.

### EN

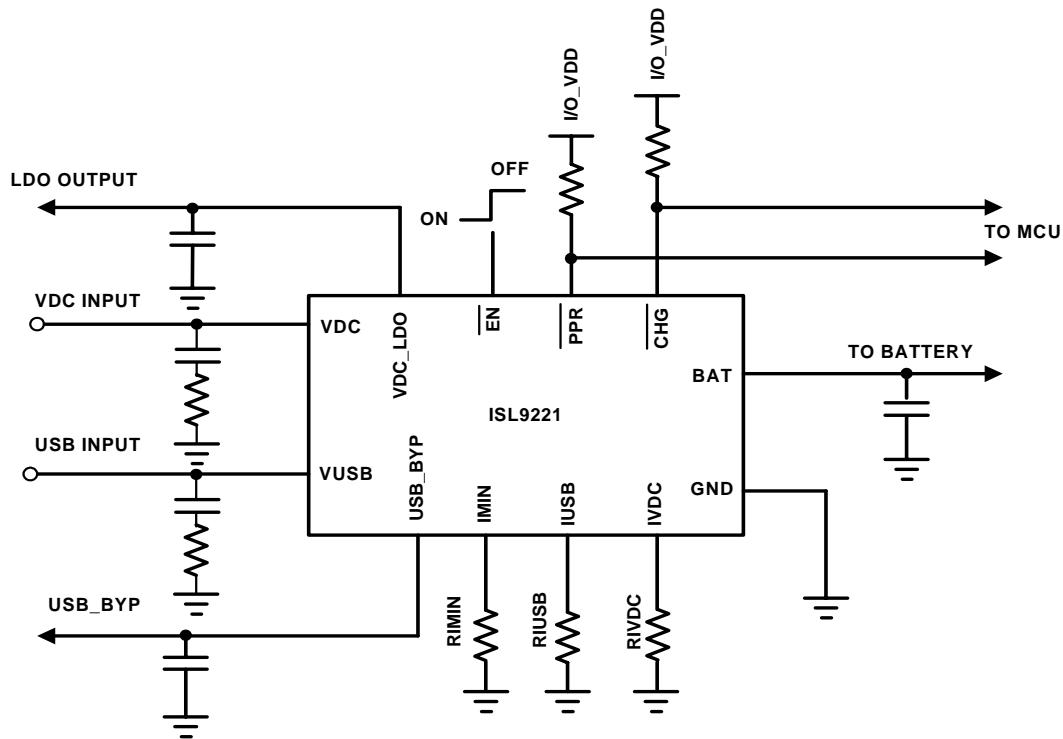

Enable charging pin. This pin is a logic level input to control charging by the system processor. An external pull-up resistor should be connected to processor's I/O power supply.

The USB\_BYP and VDC\_LDO stay on regardless of the state of this pin. This ensures that the processor can be powered up when an external source is connected to the VDC or VUSB input pin.

### PPR

Power presence indication pin. This pin is used to notify the system processor or enable the power circuitry when a source is connected. The pin is an open drain output pin, which pulls low when a valid voltage (above POR) is present at either the VDC or VUSB pin. The PPR pin is held low regardless of the state of the EN pin. If connected to the processor, a pull-up resistor should be connected to the processors I/O supply. If connected to power circuitry, a pull-up should be tied to the appropriate bypass supply.

### Typical Application

### CHG

Charge indication pin. This open-drain pin is pulled low to indicate when the battery is being charged. If connected to the processor, a pull-up resistor should be connected to the processors I/O supply.

The CHG pin can also be used to drive an LED to indicate to the user the battery is being charged.

### GND

Ground pin. This provides the ground path for all internal circuits.

## Block Diagram

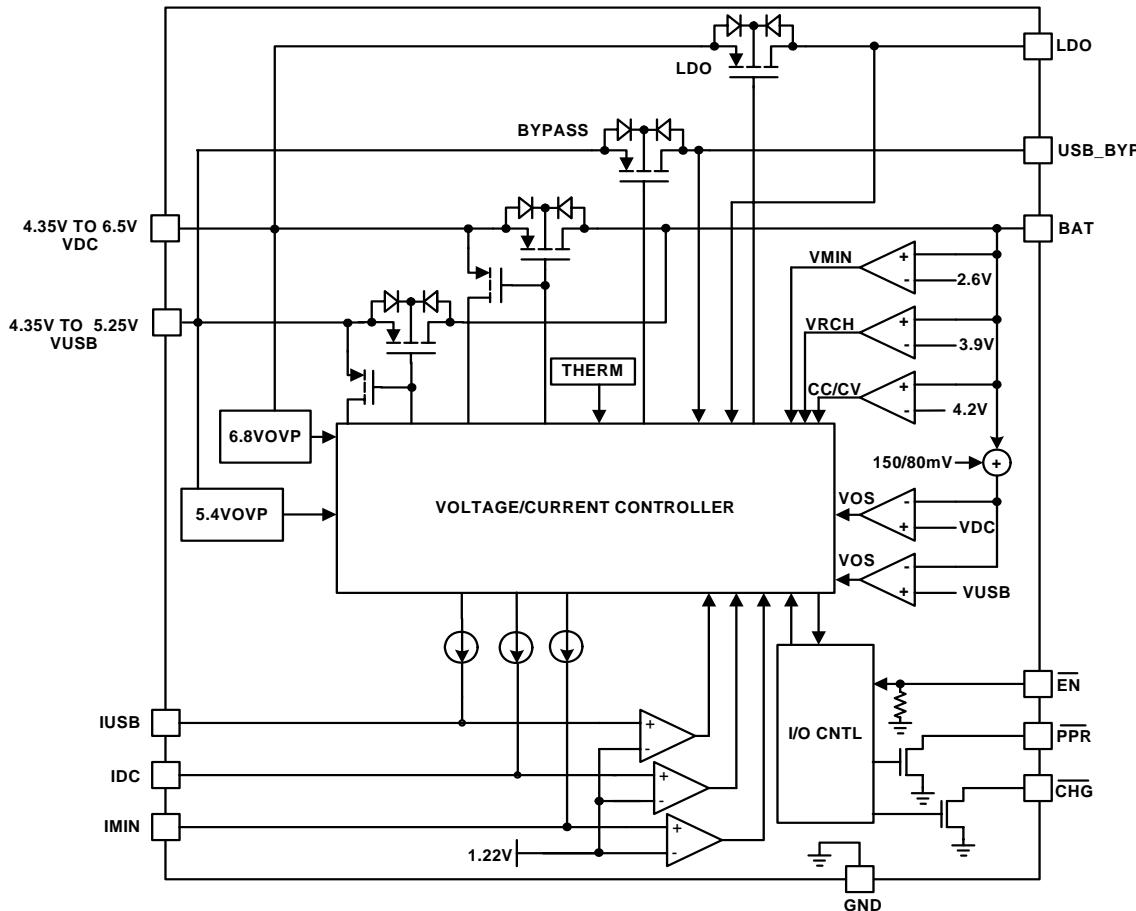

FIGURE 1. SIMPLIFIED BLOCK DIAGRAM

### USB Charge Current

When the **EN** pin is pulled low and a valid USB voltage is present at the **USB** pin, the IC will charge the battery at a rate dependent on the **IUSB** setting. The charge current maybe reduced by the USB source if it is set to a value higher than the current limit of the USB source.

Equation 1 for setting the **IUSB** current is as follows:

$$I_{USB} = \frac{6820}{R_{IUSB}} \text{ (mA)} \quad (\text{EQ. 1})$$

Where  $R_{IUSB}$  is in  $\text{k}\Omega$ .

The current set by the **IUSB** pin for charging the battery is in addition to current drawn by the load on the **USB\_BYP**. The system designer should consider the maximum expected USB\_BYP load current when selecting the USB charging current so as not to exceed the current limits set by the USB standards.

Typically at room temperature, the  $r_{DS(ON)}$  across the charge path, **VUSB** to **BAT** is  $600\text{m}\Omega$ . If the entire USB current limit of  $465\text{mA}$  is being supplied to the battery, the drop across the charging FET could be more than  $300\text{mV}$ . Thus, the voltage at the **USB** pin needs to be maintained above  $\sim 4.5\text{V}$ .

Otherwise, the period to charge the battery may be prolonged.

### Adapter Charge Current

When the **EN** pin is pulled low and a valid adapter voltage is present at the **VDC** pin, the IC will charge the battery at a rate dependent on the **IVDC** setting; the charge on the battery and the source connected to the **VDC** pin. An example of this is while the **IVDC** is set for  $1000\text{mA}$ , the adapter supply may only provide  $800\text{mA}$  and the battery is limited to the  $800\text{mA}$ .

Typically the  $r_{DS(ON)}$  across the charge path, **VDC** to **BAT** is  $600\text{m}\Omega$ . At a  $1.0\text{A}$  charging rate,  $600\text{mV}$  is dropped across the charge path. Thus, the voltage at the **VDC** pin needs to be maintained above  $\sim 4.80\text{V}$ . Otherwise the period to charge the battery may be prolonged.

$$I_{VDC} = \frac{6820}{R_{IVDC}} \text{ (mA)} \quad (\text{EQ. 2})$$

Where  $R_{IVDC}$  is in  $\text{k}\Omega$ .

It is recommended that the maximum charging current be programmed to between  $100\text{mA}$  and  $1200\text{mA}$ .

### Floating Charge Voltage

The floating voltage during the constant voltage phase is 4.2V. The floating voltage has 1% accuracy over the ambient temperature range of -40°C to +85°C.

### Trickle Charge Current

When the battery voltage is below 2.7V ( $V_{BAT\min}$ ), the charger operates in trickle/preconditioning mode, where the charge current is typically 18% of the programmed current set by  $R_{IVDC}$ .

### End-of-Charge Indication

When an EOC condition (charge current falls below  $IMIN$  during constant-voltage charging) is encountered, the internal open-drain MOSFET at the  $\overline{CHG}$  pin turn-off.

$IMIN$  threshold is programmable by the resistor  $R_{IMIN}$  at the  $IMIN$  pin for both adapter and USB inputs. If the programmed fast charge current is less than  $IMIN$ , then after the de-bounce period for  $V_{BAT} = V_{BAT\max}$  expires, EOC occurs. Once EOC is reached, the status is latched and can be reset by one of the following conditions:

- The part is disabled and re-enabled
- The selected input source is removed and reapplied
- The BAT pin voltage falls below the recharge threshold (~3.9V)

### $IMIN$

$IMIN$  sets the charge termination current for EOC (End-of-Charge).  $IMIN$  can be calculated by Equation 3:

$$IMIN = \frac{550}{R_{IMIN}} \text{ (mA)} \quad (\text{EQ. 3})$$

Where  $R_{IMIN}$  is in  $k\Omega$ .  $IMIN$  is applicable for both adapter and USB charging.

### Power Presence Indication

When either the Adapter power or USB is above the POR threshold, the PPR internal Open-Drain MOSFET pulls the pin low indicating that there is a valid source on one of the power input pins.

If only one source is connected and it is above  $V_{OVP}$  or both sources are connected and both exceed  $V_{OVP}$ , the PPR will be released (HIGH) indicating that the voltage at the pin(s) is invalid. If one input is valid while the other isn't, the PPR pin will be pulled low.

### Thermal Fold Back (Thermaguard™)

The thermal fold back function reduces the charge current when the internal temperature reaches the thermal foldback threshold, which is typically +125°C. This protects the charger from excessive thermal stress at high input voltages.

### Power-Good Condition

Even if there is a power present at one of the power input pins, the charger will not deliver power to the battery for charging if three of the conditions below are not met:

- $V_{DC}$  or  $V_{USB} > V_{POR}$
- $V_{DC}$  or  $V_{USB} - V_{BAT} > V_{OS}$
- $V_{DC}$  or  $V_{USB} < V_{OVP}$

Where  $V_{POR}$  is the power on reset voltage and  $V_{OS}$  is the offset voltage of the input-to-output comparator. All of these voltages have hysteresis, as given in the "Electrical Specifications" table on page 2.

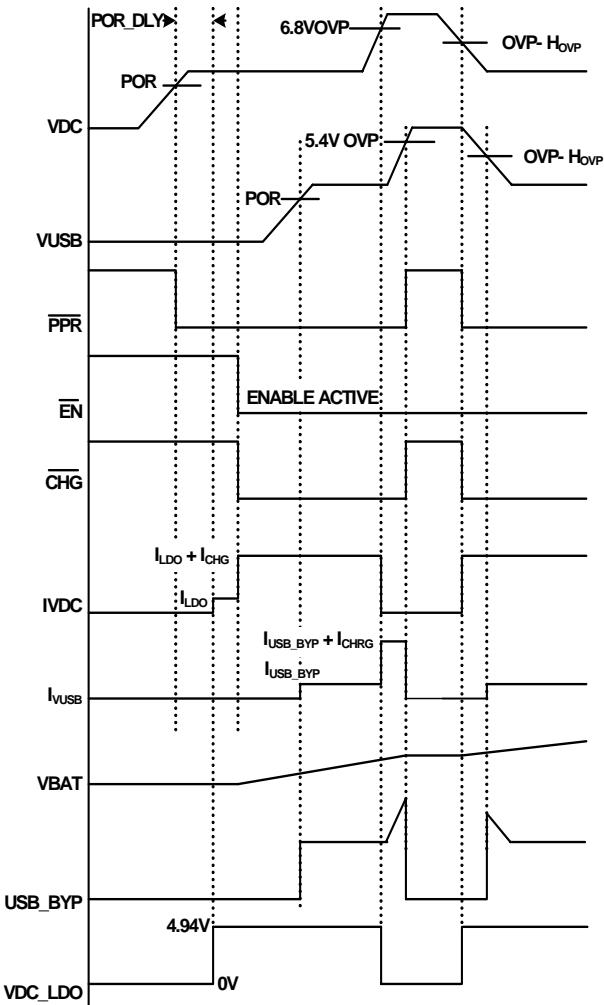

FIGURE 2. . CHARGING PROFILE

### Input Bypass Capacitors

Due to the wall or car power adapter power lead inductance, the VDC input capacitor type must be properly selected to prevent high voltage transient during a hot-plug event. This is also true for the USB input capacitor. A tantalum capacitor is a good choice for its high ESR, providing damping to the voltage transient. Multi-layer ceramic capacitors, however

have a very low ESR and hence when chosen as input capacitors, a  $1\Omega$  series resistor must be placed between the capacitor and ground, as shown in the Typical Applications Section, to provide adequate damping.

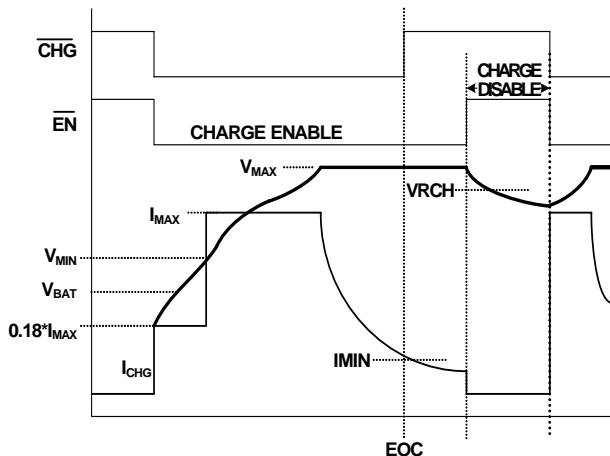

FIGURE 3. TIMING DIAGRAM

### Fault Summary

If  $VDC$  is greater than 6.8V, then the  $VDC\_LDO$  and charging FETs are turned off until  $VDC < V_{OVP} - H_{OVP}$  (Where  $H_{OVP}$  is the OVP hysteresis).  $PPR$  will be asserted high (off), unless  $VUSB$  is valid.

If  $VUSB$  is greater than 5.4V, then the  $VUSB$  bypass and charging FETs are turned off until  $VUSB < V_{OVP} - H_{OVP}$ .  $PPR$  will be asserted high (off), unless  $VDC$  is valid.

If the load on  $VUSB\_BYP$  exceeds 400mA, the FET will be current limited to protect the load and the IC.

If  $V_{USB\_BYP} > VUSB$ ,  $VUSB$  Bypass FET is turned off.

### State Diagram

The state diagram for the charger functions is shown in Figure 4. The diagram starts with the Power-off state. When at least one input voltage rises above the POR threshold, the charger resets itself. If both input voltages are above the POR threshold, the charger selects the  $VDC$  input as the power source. Then if the  $\overline{EN}$  pin is at a logic HIGH voltage, the charger will stay in the disabled state. If the  $\overline{EN}$  pin is LOW or is brought LOW charging begins. Any time the  $\overline{EN}$  pin is asserted high, the charger returns to the disabled state. When the EOC condition is reached, the  $CHG$  will turn to a logic HIGH to indicate a charge complete status but charging will continue.

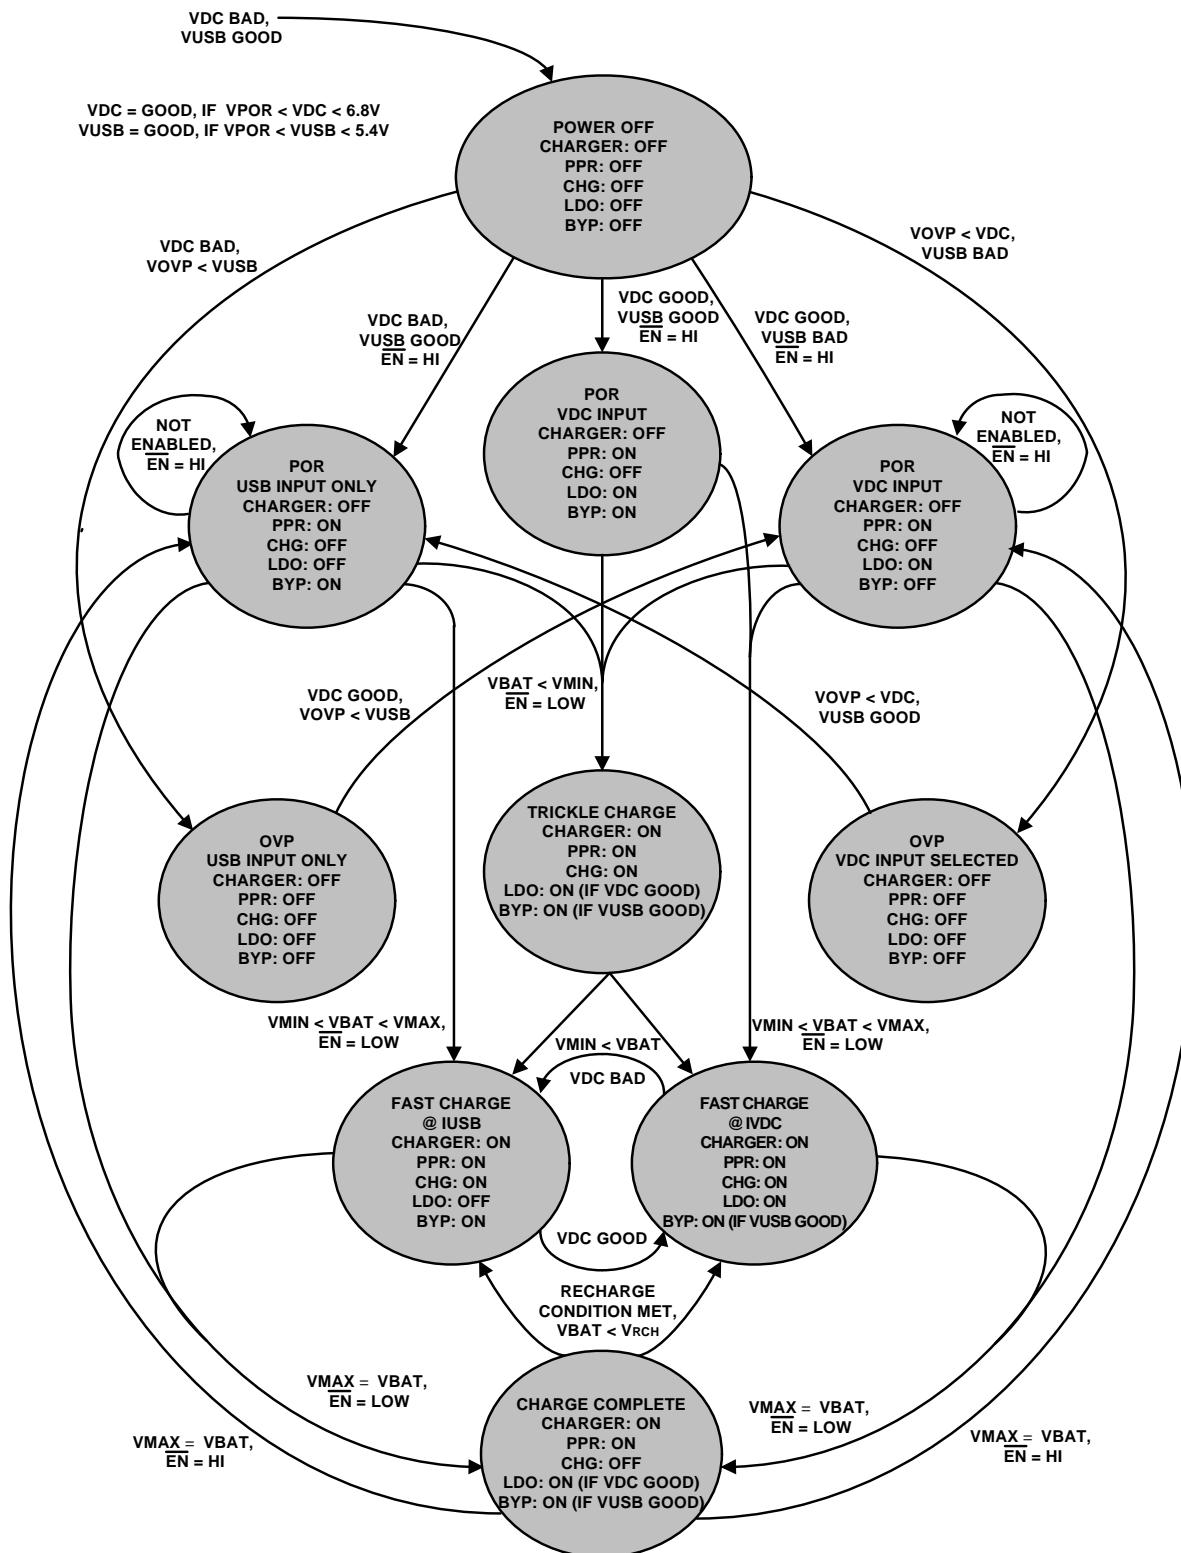

FIGURE 4. STATE DIAGRAM FOR CHARGER FUNCTIONS

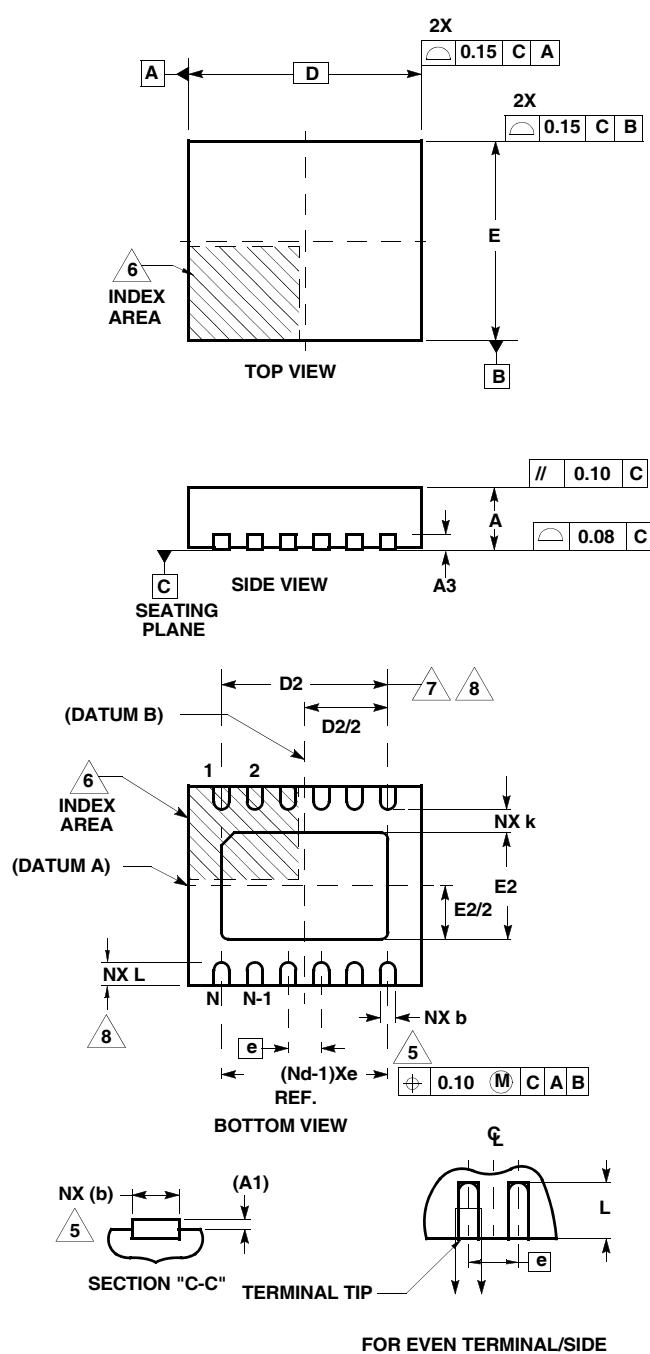

**Logic Function State Table**

VDC INPUT			USB INPUT								
$V_{IN} < V_{POR}$	PGOOD, $V_{POR} < V_{DC} < V_{OVP}$	$V_{IN} > V_{OVP}$	$V_{IN} < V_{POR}$	PGOOD, $V_{POR} < V_{USB} < V_{OVP}$	$V_{IN} > V_{OVP}$	$\overline{EN}$	$\overline{PPR}$	$\overline{CHG}$	BAT CHARGING	$V_{DC\_LDO} OUTPUT$	USB_BYP

## NOTES:

1. Dimensioning and tolerancing conform to ASME Y14.5-1994.
2. N is the number of terminals.
3. Nd refers to the number of terminals on D.
4. All dimensions are in millimeters. Angles are in degrees.
5. Dimension b applies to the metallized terminal and is measured between 0.15mm and 0.30mm from the terminal tip.
6. The configuration of the pin #1 identifier is optional, but must be located within the zone indicated. The pin #1 identifier may be either a mold or mark feature.
7. Dimensions D2 and E2 are for the exposed pads which provide improved electrical and thermal performance.
8. Nominal dimensions are provided to assist with PCB Land Pattern Design efforts, see Intersil Technical Brief TB389.

All Intersil U.S. products are manufactured, assembled and tested utilizing ISO9000 quality systems.  
Intersil Corporation's quality certifications can be viewed at [www.intersil.com/design/quality](http://www.intersil.com/design/quality)

*Intersil products are sold by description only. Intersil Corporation reserves the right to make changes in circuit design, software and/or specifications at any time without notice.
