

200kHz, 4µA, Rail-to-Rail I/O Op Amps with Shutdown

General Description

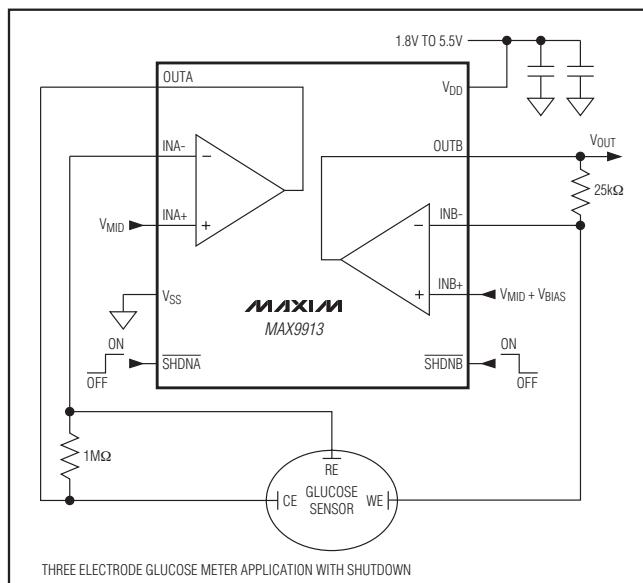

The single MAX9910/MAX9911 and dual MAX9912/MAX9913 operational amplifiers (op amps) feature a maximized ratio of gain bandwidth (GBW) to supply current and are ideal for battery-powered applications such as portable instrumentation, portable medical equipment, and wireless handsets. These CMOS op amps feature an ultra-low input-bias current of 1pA, rail-to-rail inputs and outputs, low supply current of 4µA, and operate from a single 1.8V to 5.5V supply. For additional power conservation, the MAX9911/MAX9913 feature a low-power shutdown mode that reduces supply current to 1nA, and puts the amplifiers' outputs in a high-impedance state. These devices are unity-gain stable with a 200kHz GBW product.

The MAX9910 is available in a 5-pin SC70 package. The MAX9911 is available in tiny 6-bump WLP and a 6-pin SC70 packages. The MAX9912 is available in an 8-pin SOT23 package, and the MAX9913 is available in a 10-pin µMAX® package. All devices are specified over the -40°C to +85°C extended operating temperature range.

Applications

- Portable Medical Devices
- Portable Test Equipment
- Laptops
- Data-Acquisition Equipment

Typical Operating Circuit

µMAX is a registered trademark of Maxim Integrated Products, Inc.

Features

- ◆ 200kHz GBW
- ◆ Ultra-Low 4µA Supply Current
- ◆ Single 1.8V to 5.5V Supply Voltage Range
- ◆ Ultra-Low 1pA Input Bias Current
- ◆ Rail-to-Rail Input and Output Voltage Ranges
- ◆ Low ±200µV Input Offset Voltage
- ◆ Low 0.001µA Shutdown Current
- ◆ High-Impedance Output During Shutdown (MAX9911/MAX9913)
- ◆ Unity-Gain Stable
- ◆ Available in Tiny WLP, SC70, SOT23, and µMAX Packages

MAX9910-MAX9913

200kHz, 4µA, Rail-to-Rail I/O Op Amps with Shutdown

ABSOLUTE MAXIMUM RATINGS

Power-Supply Voltage (V_{DD} to V_{SS}) -0.3V to +6.0V
 IN_+ , IN_- , OUT_- , \overline{SHDN}_- (V_{SS} - 0.3V) to (V_{DD} + 0.3V)
 Current into IN_+ , IN_- ±20mA
 Output Short-Circuit Duration to V_{DD} or V_{SS} Continuous
 Continuous Power Dissipation ($T_A = +70^\circ C$)
 5-Pin SC70 (derate 3.1mW/ $^\circ C$ above $+70^\circ C$) 247mW
 6-Bump WLP (derate 10.5mW/ $^\circ C$ above $+70^\circ C$) 840mW
 6-Pin SC70 (derate 3.1mW/ $^\circ C$ above $+70^\circ C$) 245mW

8-Pin SOT23 (derate 9.1mW/ $^\circ C$ above $+70^\circ C$) 727mW
 10-Pin µMAX (derate 5.6mW/ $^\circ C$ above $+70^\circ C$) 444mW
 Operating Temperature Range -40°C to +85°C
 Junction Temperature +150°C
 Storage Temperature Range -65°C to +150°C
 Lead Temperature (excluding WLP, soldering 10s) +300°C
 Soldering Temperature (reflow)
 Lead(Pb)-Free Packages +260°C
 Packages Containing Lead(Pb) +240°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Detailed Description

Featuring a maximized ratio of GBW to supply current, low operating supply voltage, low input bias current, and rail-to-rail inputs and outputs, the MAX9910–MAX9913 are an excellent choice for precision or general-purpose, low-current, low-voltage, battery-powered applications. These CMOS devices consume an ultra-low 4µA (typ) supply current and a 200µV (typ) offset voltage. For additional power conservation, the MAX9911/MAX9913 feature a low-power shutdown mode that reduces supply current to 1nA (typ), and puts the amplifiers' output in a high-impedance state. These devices are unity-gain stable with a 200kHz GBW product, driving capacitive loads up to 30pF. The capacitive load can be increased to 250pF when the amplifier is configured for a 10V/V gain.

Rail-to-Rail Inputs and Outputs

All of the MAX9910–MAX9913 amplifiers have a parallel-connected n- and p-channel differential input stage that allows an input common-mode voltage range that extends 100mV beyond the positive and negative supply rails, with excellent common-mode rejection.

The MAX9910–MAX9913 are capable of driving the output to within 5mV of both supply rails with a 100kΩ

load. These devices can drive a 5kΩ load with swings to within 60mV of the rails. Figure 1 shows the output voltage swing of the MAX9910–MAX9913 configured as a unity-gain buffer powered from a single 3V supply.

Low Input Bias Current

The MAX9910–MAX9913 feature ultra-low 1pA (typ) input bias current. The variation in the input bias current is minimal with changes in the input voltage due to very high input impedance (in the order of 1GΩ).

Applications Information

Driving Capacitive Loads

The MAX9910–MAX9913 amplifiers are unity-gain stable for loads up to 30pF. However, the capacitive load can be increased to 250pF when the amplifier is configured for a minimum gain of 10V/V. Applications that require greater capacitive-drive capability should use an isolation resistor between the output and the capacitive load (Figure 2). Also, in unity-gain applications with relatively small RL (approximately 5kΩ), the capacitive load can be increased up to 200pF.

Power-Supply Considerations

The MAX9910–MAX9913 are optimized for single 1.8V to 5.5V supply operation. A high amplifier power-supply

200kHz, 4µA, Rail-to-Rail I/O Op Amps with Shutdown

rejection ratio of 95dB (typ) allows the devices to be powered directly from a battery, simplifying design and extending battery life.

Power-Up Settling Time

The MAX9910–MAX9913 typically require 5µs after power-up. Supply settling time depends on the supply voltage, the value of the bypass capacitor, the output impedance of the incoming supply, and any lead resistance or inductance between components. Op-amp settling time depends primarily on the output voltage and is slew-rate limited. Figure 3 shows the MAX991_{_} in a noninverting voltage follower configuration with the input held at midsupply. The output settles in approximately 18µs for V_{DD} = 3V (see the *Typical Operating Characteristics* for power-up settling time).

Shutdown Mode

The MAX9911/MAX9913 feature active-low shutdown inputs. The MAX9911/MAX9913 enter shutdown in 2µs (typ) and exit in 30µs (typ). The amplifiers' outputs are in a high-impedance state in shutdown mode. Drive SHDN low to enter shutdown. Drive SHDN high to enable the amplifier. The MAX9913 dual-amplifier features separate shutdown inputs. Shut down both amplifiers for the lowest quiescent current.

Power-Supply Bypassing and Layout

To minimize noise, bypass V_{DD} with a 0.1µF capacitor to ground, as close to the pin as possible.

Good layout techniques optimize performance by decreasing the amount of stray capacitance and inductance to the op amps' inputs and outputs. Minimize stray capacitance and inductance by placing external components close to the IC.
