

OONS' MU120CxxxAQ_CLKS Series

moving in better ways

General - Outdoor

DWG NO. : MSSD-5764 A0

Features

· Input voltage: 90-305VAC

· Built-in active PFC function: 0.98 Typ.

· High efficiency: 92% Typ.

· IP67 design for indoor or outdoor installations

· High surge immunity

· Compliance to worldwide safety regulations for lighting

Suitable for dry/damp locations

MU120CxxxAQ_CLKS Series General - Outdoor

DWG NO. : MSSD-5764 A0

Instruction

1.Field Programmable Topology

The programmable driver can be programmed by using special PC software and the programmer module.

2.Dimming Interface Description

Pin description				CLKS DIMMING PROGRAMMING INTERFACE
Pin	Name	Value	Description	Vaux 12V / YE(黄色)
1	Vaux 12V	10.8V-13.2V	Passive dimmers power supply	1
2	Dim+/Program	0-10V	Dimming/Programming input	Dim+ Program ^{/ PU(} 紫色)
3	Dim-	0V	DC Ground	2
			•	Dim- / GR(灰色)

3.Dimming Software Function Instruction

Adjustable Output Current(AOC)

Users can set the rated current between 10%*Max Current and 100%*Max Current

PWM

Input a PWM signal from the 2nd pin(Dim+/Program) of the dimming interface to change the output current. User can set "Positive Logic" or " Negative Logic" of the PWM signal. PWM duty circle: 1%~99%(it has both positive and negative logics), frequency: 500Hz~5kHz, 3V~10V is

Adjustable Startup Time(AST)

Set driver's "Start Fade up Time". It means how much time the driver costs to achieve the "Module Current " that the user set. The valid value is 0s, 1s, 2s, 5s, 10s, 20s, 40s.

Set driver's "Fade up Time". This function is available in the Smart Midnight ClockDIM and Fixed ClockDIM mode; It means how much time the driver costs to achieve another dimming level from previous dimming level. The valid value is 0s, 1s, 2s, 5s, 10s, 20s, 40s.

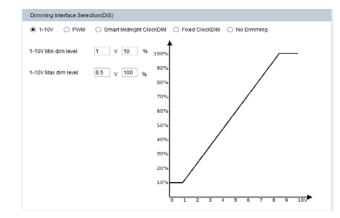

Dimming Interface Selection(DIS) O 1-10V PWM O Smart Midnight ClockDIM Fixed ClockDIM No Dimming PWM Logic(PWML) Positive Or Negative Logic + Output current percentage 100

Fade Time(FT) Fade Time(FT)

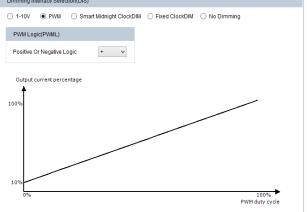

■ 1-10V

Allow users to set the max and min output current and corresponding output voltage to clarify the 1-10V dimming curve. Input a 0~10V signal from 2nd pin of the dimming interface. Default: input \leq 1V, output current 10%; input \geq

Instruction

Integrated Dynadimmer

Integrated Dynadimmer allows dimming to predefined light levels based on the nightly operating time. With flexibility in setting time and light levels, the user can configure the driver for specific locations and application needs. Using Integrated Dynadimmer, it is possible to set up to 5 dim levels and time intervals. The driver does not have a real time clock. Instead it runs a virtual clock, determined by the length of nightly operating hours. After 3 ON-OFF cycles, the driver will calculate the virtual clock time. A valid ON-time is defined as a period during which the driver operates continuously for ≥ 4 hours to \leq 24 hours. For example, if the requirement in summer is: 23:00-00:00: 75%, 00:00-04:00: 50%, 04:00-05:00: 75% (other time 100% or Off). The driver should be powered on for 7h, so it can calculate the virtual clock time as 22:00. Then we can set the dimming plan: 22:00~23:00: 100%, 23:00-00:00: 75%, 00:00-04:00: 50%, 04:00-05:00: 75%. From summer to winter, the valid ON-time changes day by day. The driver should be powered on for 17h in winter, and it also can calculate the virtual clock time as 17:00. Then the dimming plan is 17:00~23:00: 100%, 23:00-00:00: 75%, 00:00-04:00: 50%, 04:00-05:00: 75%, 05:00~10:00: 100%. From the above, if we set the dimming plan as shown in the picture, after repeating the driver ON-time for 3 consecutive days, the dimming plan takes effect from the 4th day onwards. Each day the driver powered on, it has a different start time according to the virtual clock

95 96 97 98

Allow users to separate 24hrs into 5 sections and corresponding output current.

Dimming Interface Selection(DIS)

○ 1-10V ○ PWM ○ Smart Midnight ClockDIM ○ Fixed ClockDIM ● No Dimming

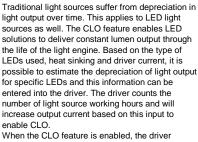

The driver will be in constant output mode.

Set MODULE Working hrs(SMW)

Set Module Working hrs(SMW)

User can check how much time the driver works through this function.

nominal output current will be defined by the CLO percentage as shown by the equation below: Driver target nominal output current = CLO percentage * AOC. For example, in the CLO profile shown in Figure, between 52,000-60,000 working hours, the CLO percentage is set at 98%. Assuming the nominal AOC is set to 500mA, the driver output current with CLO enabled will be 0.98 x 500 = 600 mA.

The CLO percentage can be set to a value between 85%-100%, in increments of 1%. The LED module n ha aat at any value hat
