

- **Ideal Front-End Filter for European Wireless Receivers**
- **Low-Loss, Coupled-Resonator Quartz Design**
- **Simple External Impedance Matching**
- **Complies with Directive 2002/95/EC (RoHS)**

The RF3319D is a low-loss, compact, and economical surface-acoustic-wave (SAW) filter designed to provide front-end selectivity in 868.95 MHz receivers. Receiver designs using this filter include superhet with 10.7 MHz or 500 kHz IF, direct conversion and superregen. Typical applications of these receivers are wireless remote-control and security devices operating in Europe under ETSI I-ETS 300 220, in Germany under FTZ 17 TR 2100, in the United Kingdom under DTI MPT 1340 (for automotive only), in France under PTT Specifications ST/PAA/TPA/AGH/1542, and in Scandinavia.

This coupled-resonator filter (CRF) uses selective null placement to provide suppression, typically greater than 40 dB, of the LO and image spurious responses of superhet receivers with 10.7 MHz IF. Murata's advanced SAW design and fabrication technology is utilized to achieve high performance and very low loss with simple external impedance matching (not included).

RF3319D

868.95 MHz SAW Filter

SM3838-8 Case
3.8 x 3.8

Characteristic	Sym	Notes	Minimum	Typical	Maximum	Units
Center Frequency @ 25°C Absolute Frequency	f _C	1, 2, 3		868.95		MHz
Insertion Loss	IL	1		2.2	4.0	dB
3 dB Bandwidth	BW ₃	1, 3	500	650	900	kHz
Attenuation: (relative to ILmin)	10 - 700 MHz	1, 3	50	55		dB
	700 - 830 MHz		40	45		
	830 - 850 MHz		35	40		
	850 - 865 MHz		20	24		
	871 - 878 MHz		21	30		
	878 - 883 MHz		15	20		
	883 - 900 MHz		28	35		
	900 - 1000 MHz		40	45		
Temperature Freq. Temp. Coefficient	FTC	3, 4		0.032		ppm/ °C ²
Frequency Aging Absolute Value during the First Year	fA	5		<±10		ppm/yr
Impedance @ f _C Input Z _{IN} = R _{IN} /C _{IN} 						

CAUTION: Electrostatic Sensitive Device. Observe precautions for handling.

NOTES:

- Unless noted otherwise, all measurements are made with the filter installed in the specified test fixture which is connected to a 50 Ω test system with VSWR \leq 1.2:1. The test fixture L and C are adjusted for minimum insertion loss at the filter center frequency, f_C . Note that insertion loss and bandwidth are dependent on the impedance matching component values and quality.
- The frequency f_C is defined as the midpoint between the 3dB frequencies.
- Where noted, specifications apply over the entire specified operating temperature range of -40 to 90°C.
- The turnover temperature, T_O , is the temperature of maximum (or turnover) frequency, f_O . The nominal frequency at any case temperature, T_C , may be calculated from:
 $f = f_O [1 - FTC (T_O - T_C)^2]$.
- Frequency aging is the change in f_C with time and is specified at +65°C or less. Aging may exceed the specification for prolonged temperatures above +65°C. Typically, aging is greatest the first year after manufacture, decreasing significantly in subsequent years.
- The design, manufacturing process, and specifications of this device are subject to change without notice.
- One or more of the following U.S. Patents apply: 4,54,488, 4,616,197, and others pending.
- All equipment designs utilizing this product must be approved by the appropriate government agency prior to manufacture or sale.
- Tape and Reel Standard for ANSI / EIA 481.

Rating	Value	Units
Input Power Level	10	dBm
