FST16292 12-Bit to 24-Bit Multiplexer/Demultiplexer Bus Switch

General Description

FAIRCHILD

SEMICONDUCTOR

The Fairchild Switch FST16292 provides twelve 2:1 highspeed CMOS TTL-compatible multiplexer/demultiplexer bus switches. The low on resistance of the switch allows inputs to be connected to outputs without adding propagation delay or generating additional ground bounce noise.

The select pin connects the A Port to the selected B Port output. The A2 Ports are not externally connected, thus have a 500 Ω pull-down resistor to ground.

Features

- \blacksquare 4 Ω switch connection between two ports.
- Minimal propagation delay through the switch.
- Low I_{CC}.
- Zero bounce in flow-through mode.
- Control inputs compatible with TTL level.
- Internal 500 Ω pull-down resistor on A₂ Port.

Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum rating. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 2: The input and output negative voltage ratings may be exceeded if the input and output diode current ratings are observed.

DC Electrical Characteristics

Note 3: Typical values are at V_{CC} = 5.0V and T_A =+25^{\circ}C

Note 4: Measured by the voltage drop between A and B pins at the indicated current through the switch. On resistance is determined by the lower of the voltages on the two (A or B) pins.

Note 6: $T_A = +25^{\circ}C$, f = 1 MHz, Capacitance is characterized but not tested.
