CCB LC75344MD

CMOS LSI

Two-Channel Electronic Volume Control System

Overview

The LC75344MD is a two-channel electronic volume control IC that is controlled by data input over a serial interface.

Functions

- Volume control: 0 dB to -50 dB in 1 dB steps, -52 dB to -78 dB in 2 dB steps, and $-\infty$, for a total of 66 positions. A balance function can be implemented by controlling the left and right channels independently.

Features

- Built-in buffer amplifiers minimize the number of external components required.
- Fabricated in a silicon gate CMOS process to minimize the switching noise generated by internal switches.
- Built-in reference voltage generation circuit for the analog ground level.
- All settings are controlled by data input over a serial interface that conforms to the CCB specifications.

LIN RIN	1 10	Volume control inputs	
LOUT ROUT	2 9	Volume control outputs	
Vref	7	VDD × 0.5 voltage generator block for the analog ground level. A capacitor with a value a few times 10 μF must be inserted between Vref and AVSS (VSS) to minimize power supply ripple.	
VSS	8	Ground	
VDD	3	Power supply	
CE	6	Chip enable The internal latch data is written and the analog switches operate at the point this pin goes from high to low. Data transfer is enabled when this pin is at the high level.

Usage Notes

- The states of the internal analog switches are undefined after power is first applied. Muting must be applied externally until the control data has been sent.
- When performing the initial settings after power is first applied, both the left and right channel initial settings data must be sent before releasing the external mute.
- Either cover the CL, DI, and CE lines with the ground pattern or use shielded lines to prevent high-frequency digital noise from entering the analog signal system from these lines.
