1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

BUFFER POWER-UP STATE MACHINE<sup>(1)</sup>

State	Description
State0	Power off
State1	After 3.3V supply is detected to rise above 1.8-2V, the buffer enters state1 and initiates a 0.2ms-0.3ms delay. The total power up latency from power on to all outputs active must be less than 1ms (assume SRC_IN is available)
State2	Buffer waits for a valid clock on the SRC_IN input and PD de-assertion.
State3	Only after SRC_IN and power valid, PD de-asserted with the current mirror stable, or PLL lock, the DIF outputs are enabled

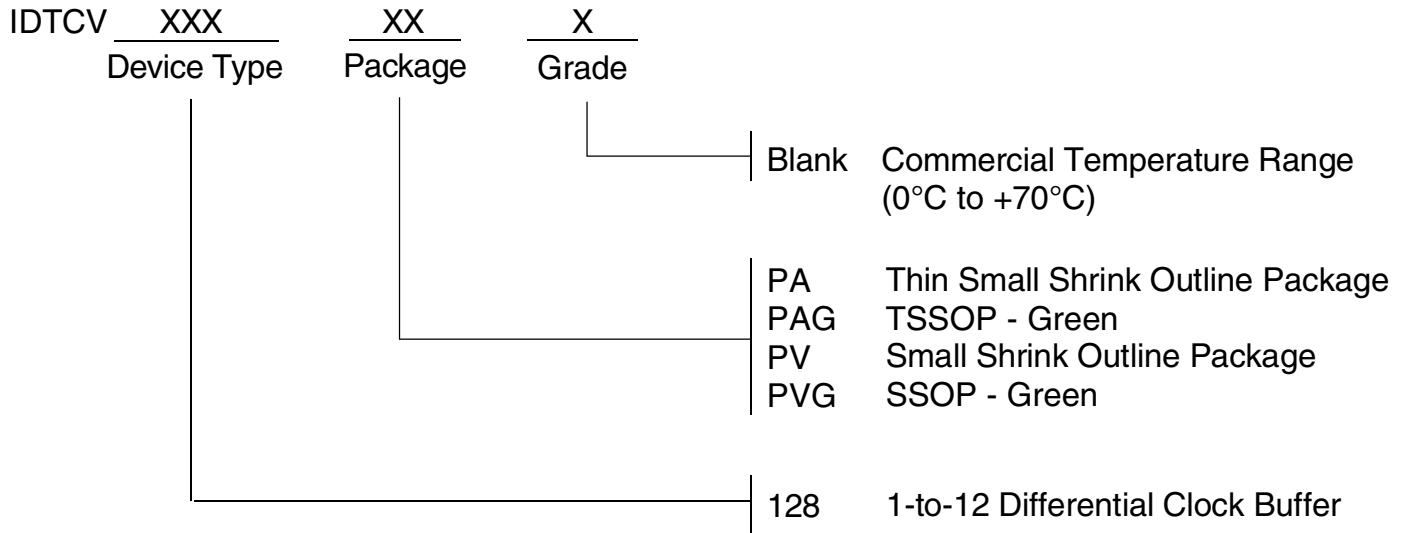

NOTE:

1. The total power up latency from power on to all outputs active must be less than 1ms (assuming a valid clock is present on CLK\_IN input). If power is valid and PWRDWN is de-asserted but no input clocks are present on the CLK\_IN input, DIF clocks must remain disabled. Only after valid input clocks are detected, valid power, PWRDWN# de-asserted with the PLL locked/stable and the DIF outputs enabled (doesn't apply to bypass mode).
