

# OVERVOLTAGE AND OVERCURRENT PROTECTION IC AND Li+ CHARGER FRONT-END PROTECTION IC

Check for Samples: [bq24300](#) [bq24304](#) [bq24305](#)

## FEATURES

- Provides Protection for Three Variables:
  - Input Overvoltage
  - Input Overcurrent with Current Limiting
  - Battery Overvoltage
- 30V Maximum Input Voltage
- Optional Input Reverse Polarity Protection
- High Immunity Against False Triggering Due to Voltage Spikes
- Robust Against False Triggering Due to Current Transients

- Thermal Shutdown
- Enable Function
- Small 2 mm × 2 mm 8-Pin SON Package
- LDO Mode Voltage Regulation Options:
  - 5.5V on bq24300
  - 4.5V on bq24304
  - 5.0V on bq24305

## APPLICATIONS

- Bluetooth Headsets
- Low-Power Handheld Devices

## DESCRIPTION

The bq24300 and bq24304 are highly integrated circuits designed to provide protection to Li-ion batteries from failures of the charging circuit. The IC continuously monitors the input voltage, the input current, and the battery voltage. The device operates like a linear regulator: for voltages up to the Input Overvoltage threshold, the output is held at 5.5V (bq24300), 5.0V (bq24305) or 4.5V (bq24304). In case of an input overvoltage condition, if the overvoltage condition persists for more than a few microseconds, the IC removes power from the charging circuit by turning off an internal switch. In the case of an overcurrent condition, it limits the current to a safe value for a blanking duration before turning the switch off. Additionally, the IC also monitors its own die temperature and switches off if it becomes too hot.

The IC also offers optional protection against reverse voltage at the input with an external P-channel MOSFET.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### ORDERING INFORMATION<sup>(1)</sup>

DEVICE <sup>(2)</sup>	OUTPUT REGULATION VOLTAGE	PACKAGE	MARKING
bq24300	5.5V	2mm x 2mm SON	BZA
bq24304	4.5V	2mm x 2mm SON	CBS
bq24305	5.0V	2mm x 2mm SON	DSG

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI website at [www.ti.com](http://www.ti.com).

(2) To order a 3000 pcs reel add R to the part number, or to order a 250 pcs reel add T to the part number.

### PACKAGE DISSIPATION RATINGS

PACKAGE	$R_{\theta JC}$	$R_{\theta JA}$ <sup>(1)</sup>
DSG	5°C/W	75°C/W

(1) This data is based on using the JEDEC High-K board and the exposed die pad is connected to a Cu pad on the board. The pad is connected to the ground plane by a 2x3 via matrix.

### ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

over operating free-air temperature range (unless otherwise noted)

PARAMETER	PIN	VALUE	UNIT
Input voltage	IN, PGATE (with respect to VSS)	–0.3 to 30	V
	OUT (with respect to VSS)	–0.3 to 12	V
	$\overline{CE}$ , VBAT (with respect to VSS)	–0.3 to 7	V
ESD Withstand voltage	All (Human Body Model per JESD22-A114-E)	2000	V
	All (Machine Model per JESD22-A115-A)	200	V
	All (Charged Device Model per JESD22-C101-C)	500	V
	IN (IEC 61000-4-2) (with IN pin bypassed to VSS with 1.0- $\mu$ F low-ESR ceramic capacitor)	15 (Air Discharge) 8 (Contact)	kV
Junction temperature, $T_J$		–40 to 150	°C
Storage temperature, $T_{STG}$		–65 to 150	°C

(1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
$V_{IN}$	Input voltage range	3.3	26	V
$T_J$	Junction temperature	0	125	°C

## ELECTRICAL CHARACTERISTICS

over junction temperature range  $0^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$  and recommended supply voltage (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT		
POWER-ON-RESET

## TERMINAL FUNCTIONS

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
IN	1	I	Input power, connect to external DC supply. Connect external 0.1μF (minimum) ceramic capacitor to VSS
VSS	2	–	Ground terminal
PGATE	3	O	Gate drive for optional external P-FET
NC	4, 7		Do not connect to any external circuit. These pins may have internal connections used for test purposes.
$\overline{\text{CE}}$	5	I	Chip enable input. Active low. When $\overline{\text{CE}}$ = Hi, the input FET is off. Internally pulled down.
VBAT	6	I	Battery voltage sense input. Connect to pack positive terminal through a resistor.
OUT	8	O	Output terminal to the charging system. Connect external 1μF capacitor (minimum) ceramic capacitor to VSS
Thermal PAD		–	There is an internal electrical connection between the exposed thermal pad and the VSS pin of the device. The thermal pad must be connected to the same potential as the VSS pin on the printed circuit board. Do not use the thermal pad as the primary ground input for the device. VSS pin must be connected to ground at all times.

## TYPICAL OPERATING PERFORMANCE

Test conditions (unless otherwise noted) for typical operating performance are:  $V_{IN} = 5\text{ V}$ ,  $C_{IN} = 1\text{ }\mu\text{F}$ ,  $C_{OUT} = 1\text{ }\mu\text{F}$ ,  $R_{BAT} = 100\text{ k}\Omega$ ,  $R_{OUT} = 22\text{ }\Omega$ ,  $T_A = 25^\circ\text{C}$  (see Figure 22 - Typical Application Circuit)

## DETAILED FUNCTIONAL DESCRIPTION

The bq24300 and bq24304 are highly integrated circuits designed to provide protection to Li-ion batteries from failures of the charging circuit. The IC continuously monitors the input voltage, the input current and the battery voltage, and protects down-stream circuitry from damage if any of these parameters exceeds safe values. The IC also monitors its own die temperature and switches off if it becomes too hot.

The IC also offers optional protection against reverse voltage at the input with an external P-channel MOSFET.

### POWER DOWN

The device remains in power down mode when the input voltage at the IN pin is below the under-voltage threshold  $V_{UVLO}$ . The FET Q1 (see [Figure 1](#)) connected between IN and OUT pins is off.

### POWER-ON RESET

The device resets all internal timers when the input voltage at the IN pin exceeds the UVLO threshold. The gate driver for the external P-FET is enabled. The IC then waits for duration  $t_{DGL(PGOOD)}$  for the input voltage to stabilize. If, after  $t_{DGL(PGOOD)}$ , the input voltage and battery voltage are safe, FET Q1 is turned ON. The IC has a soft-start feature to control the inrush current. This soft-start minimizes voltage ringing at the input (the ringing occurs because the parasitic inductance of the adapter cable and the input bypass capacitor form a resonant circuit). [Figure 2](#) shows the power-up behavior of the device. Because of the deglitch time at power-on, if the input voltage rises rapidly to beyond the OVP threshold, the device will not switch on at all, as shown in [Figure 3](#).

### OPERATION

The device continuously monitors the input voltage, the input current and the battery voltage as described in detail in the following sections:

#### Input Overvoltage Protection

As long as the input voltage is less than  $V_{O(REG)}$ , the output voltage tracks the input voltage (less the drop caused by  $R_{DS(ON)}$  of Q1). If the input voltage is greater than  $V_{O(REG)}$  (plus the  $R_{DS(ON)}$  drop) and less than  $V_{OVP}$ , the device acts like a series linear regulator, with the output voltage regulated to  $V_{O(REG)}$ . If the input voltage rises above  $V_{OVP}$ , the output voltage is clamped to  $V_{O(REG)}$  for a blanking duration  $t_{BLANK(OVP)}$ . If the input voltage returns below  $V_{OVP}$  within  $t_{BLANK(OVP)}$ , the device continues normal operation (see [Figure 4](#)). This provides protection against turning power off due to transient overvoltage spikes while still protecting the system. However, if the input voltage remains above  $V_{OVP}$  for more than  $t_{BLANK(OVP)}$ , the internal FET is turned off, removing power from the circuit (see [Figure 5](#)). When the input voltage comes back to a safe value, the device waits for  $t_{ON(OVP)}$  then switches on Q1 and goes through the soft-start routine (see [Figure 7](#)).

[Figure 6](#) describes graphically the behavior of the OUT pin over the entire range of input voltage variation.

#### Input Overcurrent Protection

The device can supply load current up to  $I_{OCP}$  continuously. If the load current tries to exceed this threshold, the current is limited to  $I_{OCP}$  for a maximum duration of  $t_{BLANK(OCP)}$ . If the load current returns to less than  $I_{OCP}$  before  $t_{BLANK(OCP)}$  times out, the device continues to operate (see [Figure 9](#)). However, if the overcurrent situation persists for  $t_{BLANK(OCP)}$ , FET Q1 is turned off for a duration of  $t_{REC(OCP)}$ . It is then turned on again and the current is monitored all over again (see [Figure 10](#) and [Figure 8](#)).

To prevent the input voltage from spiking up due to the inductance of the input cable, Q1 is not turned off rapidly in an overcurrent fault condition. Instead, the gate drive of Q1 is reduced slowly, resulting in a “soft-stop”, as shown in [Figure 11](#).

#### Battery Overvoltage Protection

The battery overvoltage threshold  $BV_{OVP}$  is internally set to 4.35V. If the battery voltage exceeds the  $BV_{OVP}$  threshold for longer than  $t_{DGL(BOVP)}$ , FET Q1 is turned off (see [Figure 12](#)). This switch-off is also a soft-stop. Q1 is turned ON (soft-start) once the battery voltage drops to  $BV_{OVP} - V_{HYS-BOVP}$ .

## Thermal Protection

If the junction temperature of the device exceeds  $T_{J(OFF)}$ , FET Q1 is turned off. The FET is turned back on when the junction temperature falls below  $T_{J(OFF)} - T_{J(OFF-HYS)}$ .

## Enable Function

The IC has an enable pin which can be used to enable or disable the device. When the  $\overline{CE}$  pin is driven high, the internal FET is turned off. When the  $\overline{CE}$  pin is low, the FET is turned on if other conditions are safe. The  $\overline{CE}$  pin has an internal pull-down resistor of 200 k $\Omega$  (typical) and can be left floating.

## PGATE Pin

When used with an external P-Channel MOSFET, in addition to OVP, OCP and Battery-OVP, the device offers protection against input reverse polarity up to –30V. When operating with normal polarity, the IC first turns on due to current flow through the body-diode of the FET  $Q_{EXT}$ . The PGATE pin then goes low, turning ON  $Q_{EXT}$ . For input voltages larger than  $V_{GCLMP}$ , the voltage on the PGATE pin is driven to  $V_{IN} - V_{GCLMP}$ . This ensures that the gate to source voltage seen by  $Q_{EXT}$  does not exceed  $-V_{GCLMP}$ .

**Figure 24. Flow Diagram**

## APPLICATION INFORMATION

### Selection of $R_{BAT}$ :

It is strongly recommended that the battery not be tied directly to the VBAT pin of the device, as under some failure modes of the IC, the voltage at the IN pin may appear on the VBAT pin. This voltage can be as high as 30V, and applying 30V to the battery in case of the failure of the device can be hazardous. Connecting the VBAT pin through  $R_{BAT}$  prevents a large current from flowing into the battery in case of failure of the IC. In the interests of safety,  $R_{BAT}$  should have a very high value. The problem with a large  $R_{BAT}$  is that the voltage drop across this resistor because of the VBAT bias current  $I_{VBAT}$  causes an error in the  $BV_{OVP}$  threshold. This error is over and above the tolerance on the nominal 4.35V  $BV_{OVP}$  threshold.

Choosing  $R_{BAT}$  in the range 100k $\Omega$  to 470k $\Omega$  is a good compromise. In the case of IC failure, with  $R_{BAT}$  equal to 100k $\Omega$ , the maximum current flowing into the battery would be  $(30V - 3V) \div 100k\Omega = 270\mu A$ , which is low enough to be absorbed by the bias currents of the system components.  $R_{BAT}$  equal to 100k $\Omega$  would result in a worst-case voltage drop of  $R_{BAT} \times I_{VBAT} \approx 1mV$ . This is negligible compared to the internal tolerance of 50mV on the  $BV_{OVP}$  threshold.

If the Bat-OVP function is not required, the VBAT pin should be connected to VSS.

### Selection of $R_{CE}$ :

The  $\overline{CE}$  pin can be used to enable and disable the IC. If host control is not required, the  $\overline{CE}$  pin can be tied to ground or left un-connected, permanently enabling the device.

In applications where external control is required, the  $\overline{CE}$  pin can be controlled by a host processor. As in the case of the VBAT pin (see above), the  $\overline{CE}$  pin should be connected to the host GPIO pin through as large a resistor as possible. The limitation on the resistor value is that the minimum  $V_{OH}$  of the host GPIO pin less the drop across the resistor should be greater than  $V_{IH}$  of the bq2430x  $\overline{CE}$  pin. The drop across the resistor is given by  $R_{CE} \times I_{IH}$ .

### Selection of Input and Output Bypass Capacitors:

The input capacitor  $C_{IN}$  in [Figure 22](#) and [Figure 23](#) is for decoupling, and serves an important purpose. Whenever there is a step change downwards in the system load current, the inductance of the input cable causes the input voltage to spike up.  $C_{IN}$  prevents the input voltage from overshooting to dangerous levels. It is strongly recommended that a ceramic capacitor of at least 1 $\mu F$  be used at the input of the device. It should be located in close proximity to the IN pin.

$C_{OUT}$  in [Figure 23](#) is also important: If a fast ( $< 1\mu s$  rise-time) overvoltage transient occurs at the input, the current that charges  $C_{OUT}$  causes the device's current-limiting loop to kick in, reducing the gate-drive to FET Q1. This results in improved performance for input overvoltage protection.  $C_{OUT}$  should also be a ceramic capacitor of at least 1 $\mu F$ , located close to the OUT pin.  $C_{OUT}$  also serves as the input decoupling capacitor for the charging circuit downstream of the protection IC.

### PCB Layout Guidelines:

1. This device is a protection device, and is meant to protect down-stream circuitry from hazardous voltages. Potentially, high voltages may be applied to this IC. It has to be ensured that the edge-to-edge clearances of PCB traces satisfy the design rules for the maximum voltages expected to be seen in the system.
2. The device uses SON packages with a PowerPAD™. For good thermal performance, the PowerPAD should be thermally coupled with the PCB ground plane. In most applications, this will require a copper pad directly under the IC. This copper pad should be connected to the ground plane with an array of thermal vias.
3.  $C_{IN}$  and  $C_{OUT}$  should be located close to the IC. Other components like  $R_{BAT}$  should also be located close to the IC.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PLASTIC SMALL OUTLINE NO-LEAD

4208210/B 10/10

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Quad Flatpack, No-Leads (QFN) package configuration.
  -  The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
  - E. Falls within JEDEC MO-229.

### THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

Exposed Thermal Pad Dimensions

NOTE: All linear dimensions are in millimeters

DSG (S-PWSON-N8)

PLASTIC SMALL OUTLINE NO-LEAD

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate designs.
  - D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - F. Customers should contact their board fabrication site for solder mask tolerances.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
