DATA SHEET

STK672-432B-E — Thick-Film Hybrid IC 2-phase Stepping Motor Driver

Overview

The STK672-432B-E is a hybrid IC for use as a unipolar, 2-phase stepping motor driver with PWM current control.

Applications

- Office photocopiers, printers, etc.

Features

- Built-in motor terminal open detection function (output current OFF).
- Built-in overcurrent detection function (output current OFF).
- Built-in overheat detection function (output current OFF).
- FAULT1 signal (active low) is output when any of motor terminal open, overcurrent, or overheat is detected.
The FAULT2 signal is used to output the result of activation of protection circuit detection at 3 levels.
- Built-in power on reset function.
- A micro-step sine wave-driven driver can be activated merely by inputting an external clock.
- External pins can be used to select 2, 1-2 (including pseudo-micro), W1-2, 2 W1-2, or 4W1-2 excitation.
- The switch timing of the 4-phase distributor can be switched by setting an external pin (MODE3) to detect either the rise and fall, or rise only, of CLOCK input.
- Phase is maintained even when the excitation mode is switched. Rotational direction switching function.
- Supports schmitt input for 2.5V high level input.
- Incorporating a current detection resistor (0.152Ω: resistor tolerance $\pm 2\%$), motor current can be set using two external resistors.
- The ENABLE pin can be used to cut output current while maintaining the excitation mode.
- With a wide current setting range, power consumption can be reduced during standby.
- No motor sound is generated during hold mode due to external excitation current control.

■ Any and all SANYO Semiconductor Co.,Ltd. products described or contained herein are, with regard to "standard application", intended for the use as general electronics equipment (home appliances, AV equipment, communication device, office equipment, industrial equipment etc.). The products mentioned herein shall not be intended for use for any "special application" (medical equipment whose purpose is to sustain life, aerospace instrument, nuclear control device, burning appliances, transportation machine, traffic signal system, safety equipment etc.) that shall require extremely high level of reliability and can directly threaten human lives in case of failure or malfunction of the product or may cause harm to human bodies, nor shall they grant any guarantee thereof. If you should intend to use our products for applications outside the standard applications of our customer who is considering such use and/or outside the scope of our intended standard applications, please consult with us prior to the intended use. If there is no consultation or inquiry before the intended use, our customer shall be solely responsible for the use.

■ Specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.

Specifications

Absolute Maximum Ratings at $T_c = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	unit
Maximum supply voltage 1	V_{CC} max	No signal	50	V
Maximum supply voltage 2	V_{DD} max	No signal	-0.3 to +6.0	V
Input voltage	V_{IN} max	Logic input pins	-0.3 to +6.0	V
Output current 1	I_{OP} max	10 μ s, 1 pulse (resistance load)	10	A
Output current 2	I_{OH} max	$V_{DD}=5\text{V}$, $\text{CLOCK}\geq 200\text{Hz}$	2.5	A
Allowable power dissipation 1	P_{dMF} max	With an arbitrarily large heat sink. Per MOSFET	7.3	W
Allowable power dissipation 2	P_{dPK} max	No heat sink	2.8	W
Operating substrate temperature	T_c max	Metal surface temperature of the package	-20 to +105	$^\circ\text{C}$
Junction temperature	T_j max		150	$^\circ\text{C}$
Storage temperature	T_{stg}		-40 to +125	$^\circ\text{C}$

Allowable Operating Ranges at $T_a=25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	unit
Operating supply voltage 1	V_{CC}	With signals applied	0 to 46	V
Operating supply voltage 2	V_{DD}	With signals applied	5 \pm 5%	V
Input high voltage	V_{IH}	Pins 10, 11, 12, 13, 14, 15, 17, $V_{DD}=5\pm 5\%$	2.5 to V_{DD}	V
Input low voltage	V_{IL}	Pins 10, 11, 12, 13, 14, 15, 17, $V_{DD}=5\pm 5\%$	0 to 0.8	V
Output current	I_{OH}	$T_c=105^\circ\text{C}$, $\text{CLOCK}\geq 200\text{Hz}$	2.0	A
CLOCK frequency	f_{CL}	Minimum pulse width: at least 10 μ s	0 to 50	kHz
Recommended Vref range	Vref		0.14 to 1.48	V

Electrical Characteristics at $T_c=25^\circ\text{C}$, $V_{CC}=24\text{V}$, $V_{DD}=5.0\text{V}$ *1

Parameter		Symbol	Conditions	min	typ	max	unit
V_{DD} supply current		I_{CCO}	$V_{DD}=5.0\text{V}$, $\text{ENABLE}=\text{Low}$		5.7	7.0	mA
Output average current *2		I_{Oave}	$R/L=1\Omega/0.62\text{mH}$ in each phase	0.19	0.23	0.27	A

Package Dimensions

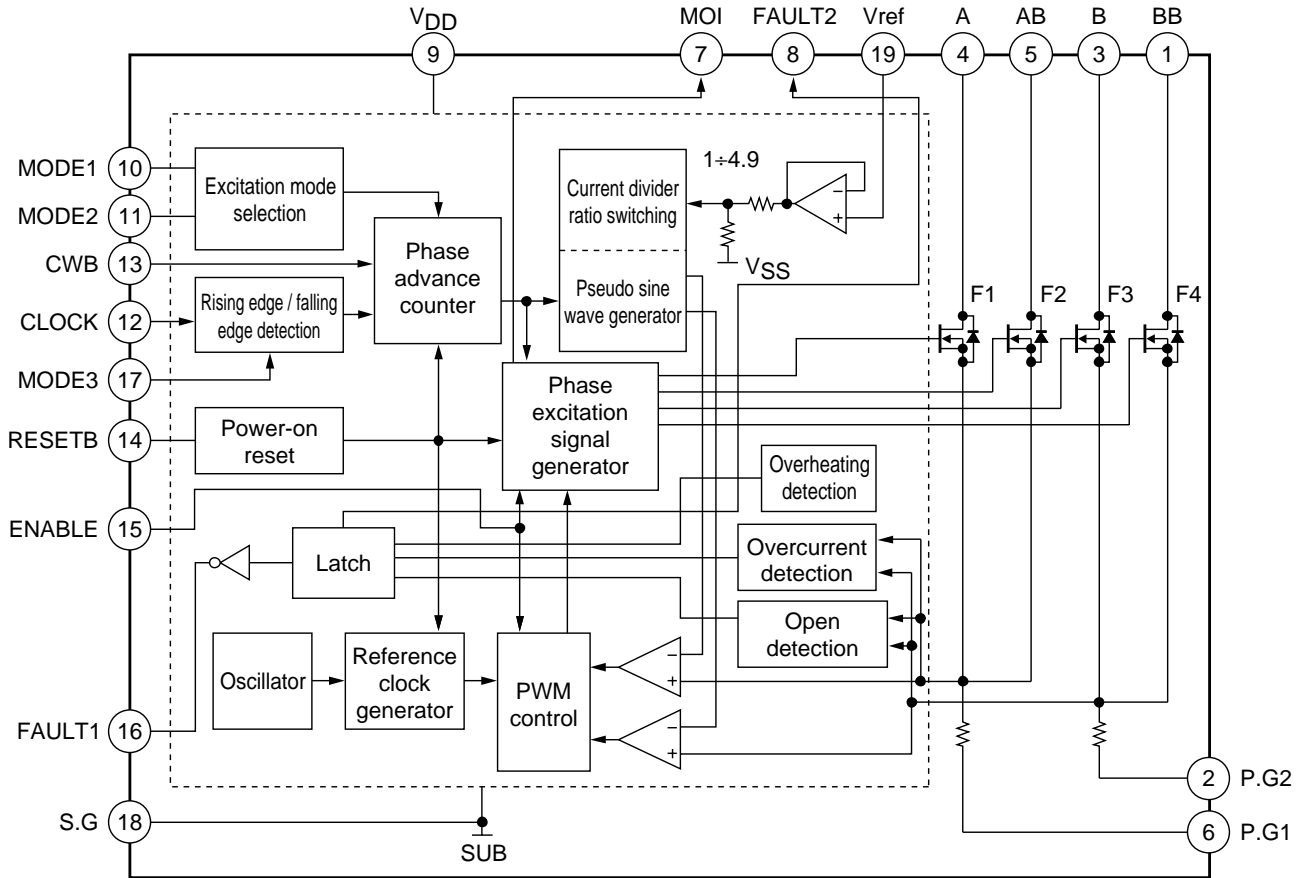

unit:mm (typ)

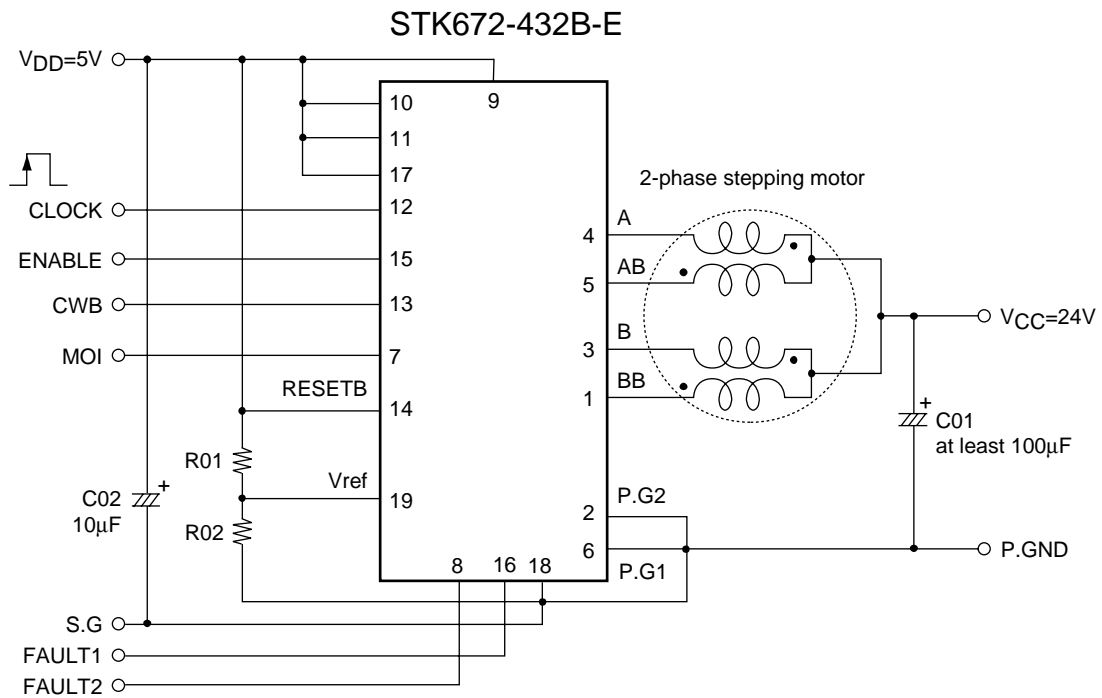

Derating Curve of Motor Current, I_{OH} , vs. STK672-432B-E Operating Substrate Temperature, T_c **Notes**

- The current range given above represents conditions when output voltage is not in the avalanche state.
- If the output voltage is in the avalanche state, see the allowable avalanche energy for STK672-4** series hybrid ICs given in a separate document.
- The operating substrate temperature, T_c , given above is measured while the motor is operating. Because T_c varies depending on the ambient temperature, T_a , the value of I_{OH} , and the continuous or intermittent operation of I_{OH} , always verify this value using an actual set.
- The T_c temperature should be checked in the center of the metal surface of the product package.

Block Diagram

Sample Application Circuit

Precautions

[GND wiring]

- To reduce noise on the 5V/24V system, be sure to place the GND of C01 in the circuit given above as close as possible to Pin 2 and Pin 6 of the hybrid IC.
In addition, in order to set the current accurately, the GND side of RO2 of Vref must be connected to the shared ground terminal used by the Pin 18 (S.G) GND, P.G1 and P.G2.

[Input pins]

- If VDD is being applied, use care that each input pin does not apply a negative voltage less than -0.3V to S.GND, Pin 18. Measures must also be taken so that a voltage equal to or greater than VDD is not input.
- High voltage input other than VDD, MOI, FAULT1, and FAULT2 is 2.5V.
- Pull-up resistors are not connected to input pins. Pull-down resistors are attached. When controlling the input to the hybrid IC with the open collector type, be sure to connect a pull-up resistor (1 to 20kΩ).
Be sure to use a device (0.8V or less, low level, when IOL=5mA) for the open collector driver at this time that has an output voltage specification such that voltage is pulled to less than 0.8V at low level.
- When using the power on reset function built into the hybrid IC, be sure to directly connect Pin 14 to VDD.
- We recommend attaching a 1,000pF capacitor to each input to prevent malfunction during high-impedance input. Be sure to connect the capacitor near the hybrid IC, between Pin 18 (S, G).
- When input is fixed low, directly connect to Pin 18. When input is fixed high, directly connect to VDD.

[Current setting Vref]

If the motor current is temporarily reduced, the circuit given below is recommended.
The variable voltage range of Vref input is 0.14 to 1.48V.

[Setting the motor current]

The motor current, IOH, is set using the Pin 19 voltage, Vref, of the hybrid IC. Equations related to IOH and Vref are given below.

$$V_{ref} \approx (RO2 \div (RO2 + RO1)) \times V_{DD}(5V) \dots\dots\dots (1)$$

$$I_{OH} \approx (V_{ref} \div 4.9) \div R_s \dots\dots\dots (2)$$

The value of 4.9 in Equation (2) above represents the Vref voltage as divided by a circuit inside the control IC.

Rs: 0.152Ω (Current detection resistor inside the hybrid IC)

• Motor current peak value I_{OH} setting

[Smoke Emission Precautions]

If Pin 18 (S.G terminal) is attached to the PCB without using solder, overcurrent may flow into the MOSFET at V_{CCON} (24V ON), to emit smoke because 5V circuits cannot be controlled.

Function Table

M2	0	0	1	1	CLOCK Edge Timing for Phase Switching
M1 M3	0	1	0	1	
1	2-phase excitation selection	1-2-phase excitation (I _{OH} =100%)	W1-2 phase excitation	2W1-2 phase excitation	CLOCK rising edge
0	1-2 phase excitation (I _{OH} =100%, 71%)	W1-2 phase excitation	2W1-2 phase excitation	4W1-2 phase excitation	CLOCK both edges

$I_{OH}=100\%$ results in the V_{ref} voltage setting, I_{OH} .

During 1-2 phase excitation, the hybrid IC operates at a current setting of $I_{OH}=100\%$ when the CLOCK signal rises. Conversely, pseudo micro current control is performed to control current at $I_{OH}=100\%$ or 71% at both edges of the CLOCK signal.

CWB pin

Forward/CW	0
Reverse/CCW	1

ENABLE • RESETB pin

ENABLE	Motor current cut: Low
RESETB	Active Low

Usage Notes

1. I/O Pins and Functions of the Control Block

[Pin description]

HIC pin	Pin Name	Function
7	MOI	Output pin for the excitation monitor
19	Vref	Current value setting
10	MODE1	Excitation mode selection
11	MODE2	
17	MODE3	
12	CLOCK	External CLOCK (motor rotation instruction)
13	CWB	Sets the direction of rotation of the motor axis
14	RESETB	System reset
15	ENABLE	Motor current OFF
16	FAULT1	Motor terminal open/Overcurrent/over-heat detection output
8	FAULT2	

Description of each pin

[CLOCK (Phase switching clock)]

Input frequency: DC-20kHz (when using both edges) or DC-50kHz (when using one edge)

Minimum pulse width: 20μs (when using both edges) or 10μs (when using one edge)

Pulse width duty: 40% to 50%

Both edge, single edge operation

M3:1 The excitation phase moves one step at a time at the rising edge of the CLOCK pulse.

M3:0 The excitation phase moves alternately one step at a time at the rising and falling edges of the CLOCK pulse.

[CWB (Motor direction setting)]

When CWB=0: The motor rotates in the clockwise direction.

When CWB=1: The motor rotates in the counterclockwise direction.

Do not allow CWB input to vary during the 7μs interval before and after the rising and falling edges of CLOCK input.

[ENABLE (Forcible OFF control of excitation drive output A, AB, B, and BB, and selecting operation/hold status inside the HIC)]

ENABLE=1: Normal operation

When ENABLE=0: Motor current goes OFF, and excitation drive output is forcibly turned OFF.

The system clock inside the HIC stops at this time, with no effect on the HIC even if input pins other than RESET input vary. In addition, since current does not flow to the motor, the motor shaft becomes free.

If the CLOCK signal used for motor rotation suddenly stops, the motor shaft may advance beyond the control position due to inertia. A SLOW DOWN setting where the CLOCK cycle gradually decreases is required in order to stop at the control position.

[MODE1, MODE2, and MODE3 (Selecting the excitation mode, and selecting one edge or both edges of the CLOCK)]

Excitation select mode terminal (See the sample application circuit for excitation mode selection), selecting the CLOCK input edge(s).

Mode setting active timing

Do not change the mode within 7μs of the input rising or falling edge of the CLOCK signal.

[RESETB (System-wide reset)]

The reset signal is formed by the power-on reset function built into the HIC and the RESETB terminal.

When activating the internal circuits of the HIC using the power-on reset signal within the HIC, be sure to connect Pin 14 of the HIC to V_{DD}.

[Vref (Voltage setting to be used for the current setting reference)]

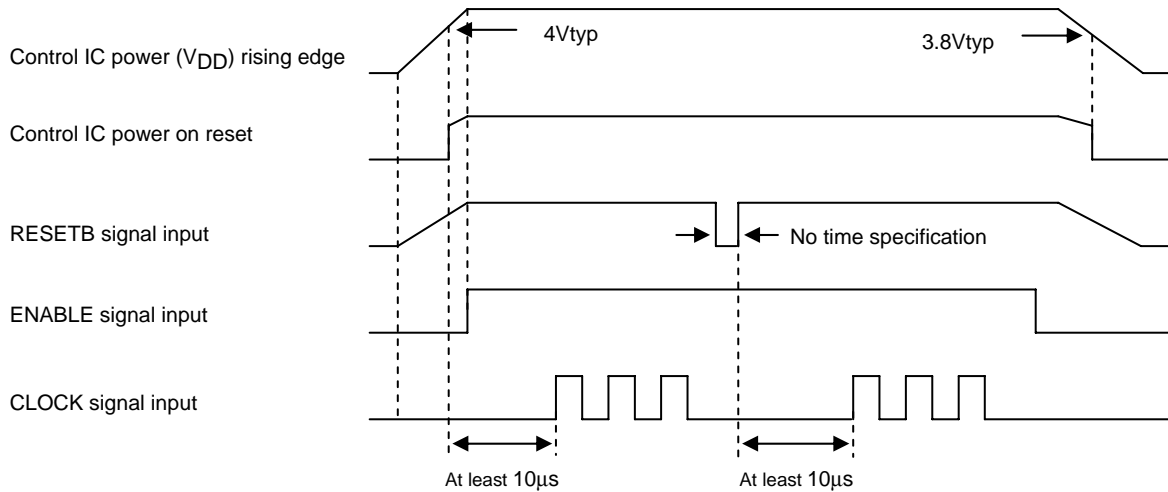

- Pin type: Analog input configuration

Input voltage is in the voltage range of 0.14V to 1.48V.

[Input timing]

The control IC of the driver is equipped with a power on reset function capable of initializing internal IC operations when power is supplied. A 4V typ setting is used for power on reset. Because the specification for the MOSFET gate voltage is $5V \pm 5\%$, conduction of current to output at the time of power on reset adds electromotive stress to the MOSFET due to lack of gate voltage. To prevent electromotive stress, be sure to set ENABLE=Low while V_{DD} , which is outside the operating supply voltage, is less than 4.75V.

In addition, if the RESETB terminal is used to initialize output timing, be sure to allow at least $10\mu s$ until CLOCK input.

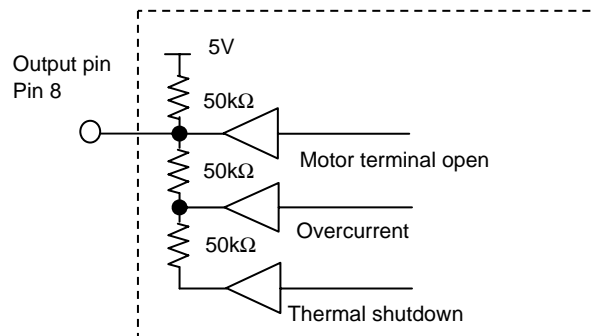

ENABLE, CLOCK, and RESETB Signals Input Timing

[Configuration of control block I/O pins]

<Configuration of the MODE1, MODE2, MODE3, CLOCK, CWB, ENABLE, and RESETB input pins>

<Configuration of the FAULT2 pin>

The input pins of this driver all use Schmitt input. Typical specifications at $T_c=25^\circ C$ are given below. Hysteresis voltage is 0.3V ($V_{IHa}-V_{ILa}$).

Input voltage specifications are as follows.

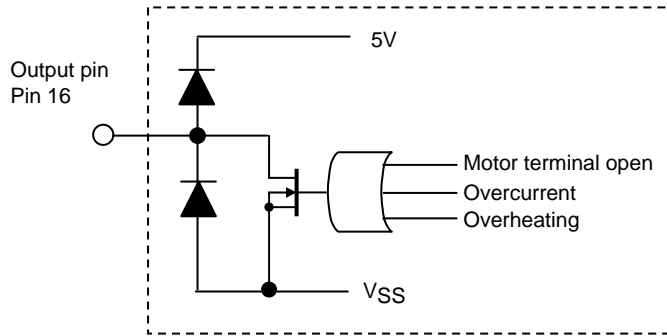

$$V_{IH}=2.5V_{min}$$

$$V_{IL}=0.8V_{max}$$

<Configuration of the Vref input pin>

<Configuration of the FAULT1 output pin>

<FAULT1, FAULT2 output>

FAULT1 Output

- FAULT1 is an open drain output. It outputs low level when any of motor terminal open, overcurrent, or overheat is detected.

FAULT2 output

Output is resistance divided (3 levels) and the type of abnormality detected is converted to the corresponding output voltage.

- Motor terminal open: 10mV (typ)
- Overcurrent: 2.5V (typ)
- Overheat: 3.3V (typ)

Abnormality detection can be released by a RESETB operation or turning VDD voltage on/off.

[MOI output]

The output frequency of this excitation monitor pin varies depending on the excitation mode. For output operations, see the timing chart.

2. STK672-422B-E/432B-E/442B-E/440B-E motor terminal open detection, overcurrent detection, and overheat detection functions

Each detection function operates using a latch system and turns output off. Because a RESET signal is required to restore output operations, once the power supply, V_{DD} , is turned off, you must either again apply power on reset with V_{DDON} or apply a RESETB=High→Low→High signal.

[Motor terminal open detection]

This hybrid IC is equipped with a function for detecting open output terminals to prevent thermal destruction of the MOSFET due to repeated avalanche operation that occurs when an output terminal connected to the motor is open. The open condition is determined by checking the presence or absence of the flyback current that flows in the motor inductance during the off period of the PWM cycle.

Detection is performed by using the fact that the flyback current does not flow when a motor terminal is open.

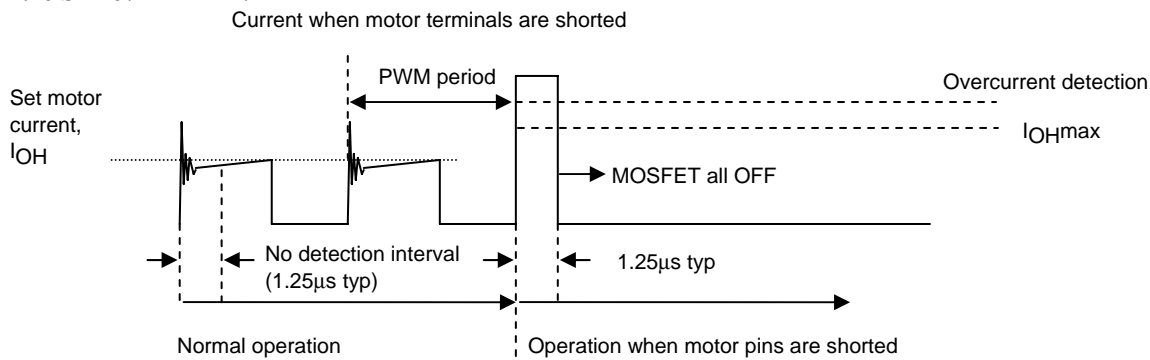

When the current level drops, the voltage difference with the GND potential becomes smaller, making detection difficult. The motor currents that can be detected by motor terminal open detection are 0.6A or more with the STK672-422B-E, 0.9A or more with the STK672-432B-E, and 1.1A or more with the STK672-442B-E/440B-E.

[Overcurrent detection]

This hybrid IC is equipped with a function for detecting overcurrent that arises when the motor burns out or when there is a short between the motor terminals.

Overcurrent detection occurs at 2.3A typ with the STK672-422B-E, 3.4A typ with the STK672-432B-E, and 5.0A typ with the STK672-442B-E.

Overcurrent detection begins after an interval of no detection (a dead time of 1.25μs typ) during the initial ringing part during PWM operations. The no detection interval is a period of time where overcurrent is not detected even if the current exceeds I_{OH} .

[Overheat detection]

Rather than directly detecting the temperature of the semiconductor device, overheat detection detects the temperature of the aluminum substrate (144°C typ).

Within the allowed operating range recommended in the specification manual, if a heat sink attached for the purpose of reducing the operating substrate temperature, T_c , comes loose, the semiconductor can operate without breaking. However, we cannot guarantee operations without breaking in the case of operations other than those recommended, such as operations at a current exceeding $I_{OH\ max}$ that occurs before overcurrent detection is activated.

3. STK672-432B-E Allowable Avalanche Energy Value

(1) Allowable Range in Avalanche Mode

When driving a 2-phase stepping motor with constant current chopping using an STK672-4** Series hybrid IC, the waveforms shown in Figure 1 below result for the output current, I_D , and voltage, V_{DS} .

Figure 1 Output Current, I_D , and Voltage, V_{DS} , Waveforms 1 of the STK672-4** Series when Driving a 2-Phase Stepping Motor with Constant Current Chopping

When operations of the MOSFET built into STK672-4** Series ICs is turned off for constant current chopping, the I_D signal falls like the waveform shown in the figure above. At this time, the output voltage, V_{DS} , suddenly rises due to electromagnetic induction generated by the motor coil.

In the case of voltage that rises suddenly, voltage is restricted by the MOSFET V_{DS} . Voltage restriction by V_{DS} results in a MOSFET avalanche. During avalanche operations, I_D flows and the instantaneous energy at this time, E_{AVL1} , is represented by Equation (3-1).

$$E_{AVL1} = V_{DS} \times I_{AVL} \times 0.5 \times t_{AVL} \text{ ----- (3-1)}$$

V_{DS} : V units, I_{AVL} : A units, t_{AVL} : sec units

The coefficient 0.5 in Equation (3-1) is a constant required to convert the I_{AVL} triangle wave to a square wave.

During STK672-4** Series operations, the waveforms in the figure above repeat due to the constant current chopping operation. The allowable avalanche energy, E_{AVL} , is therefore represented by Equation (3-2) used to find the average power loss, P_{AVL} , during avalanche mode multiplied by the chopping frequency in Equation (3-1).

$$P_{AVL} = V_{DS} \times I_{AVL} \times 0.5 \times t_{AVL} \times f_c \text{ ----- (3-2)}$$

f_c : Hz units (f_c is set to the PWM frequency of 50kHz.)

For V_{DS} , I_{AVL} , and t_{AVL} , be sure to actually operate the STK672-4** Series and substitute values when operations are observed using an oscilloscope.

Ex. If $V_{DS}=110V$, $I_{AVL}=1A$, $t_{AVL}=0.2\mu s$ when using a STK672-432B-E driver, the result is:

$$P_{AVL} = 110 \times 1 \times 0.5 \times 0.2 \times 10^{-6} \times 50 \times 10^3 = 0.55W$$

$V_{DS}=110V$ is a value actually measured using an oscilloscope.

The allowable loss range for the allowable avalanche energy value, P_{AVL} , is shown in the graph in Figure 3. When examining the avalanche energy, be sure to actually drive a motor and observe the I_D , V_{DS} , and t_{AVL} waveforms during operation, and then check that the result of calculating Equation (3-2) falls within the allowable range for avalanche operations.

(2) I_D and V_{DS} Operating Waveforms in Non-avalanche Mode

Although the waveforms during avalanche mode are given in Figure 1, sometimes an avalanche does not result during actual operations.

Factors causing avalanche are listed below.

- Poor coupling of the motor's phase coils (electromagnetic coupling of A phase and AB phase, B phase and BB phase).
- Increase in the lead inductance of the harness caused by the circuit pattern of the P.C. board and motor.
- Increases in V_{DS} , t_{AVL} , and I_{AVL} in Figure 1 due to an increase in the supply voltage from 24V to 36V.

If the factors above are negligible, the waveforms shown in Figure 1 become waveforms without avalanche as shown in Figure 2.

Under operations shown in Figure 2, avalanche does not occur and there is no need to consider the allowable loss range of $PAVL$ shown in Figure 3.

ITF02558

Figure 2 Output Current, I_D , and Voltage, V_{DS} , Waveforms 2 of the STK672-4** Series when Driving a 2-Phase Stepping Motor with Constant Current Chopping

Figure 3 Allowable Loss Range, $PAVL-I_{OH}$ During STK672-432B-E Avalanche Operations

ITF02593

Note:

The operating conditions given above represent a loss when driving a 2-phase stepping motor with constant current chopping.

Because it is possible to apply 2.6W or more at $I_{OH}=0A$, be sure to avoid using the MOSFET body diode that is used to drive the motor as a zener diode.

4. Calculating STK672-432B-E HIC Internal Power Loss

The average internal power loss in each excitation mode of the STK672-432B-E can be calculated from the following formulas. *1

[Each excitation mode]

2-phase excitation mode

$$2PdAVex = 2 \times V_{sat} \times 0.5 \times CLOCK \times I_{OH} \times t_2 + 0.5 \times CLOCK \times I_{OH} \times (V_{sat} \times t_1 + V_{df} \times t_3) \text{ ----- (4-1)}$$

1-2 Phase excitation mode

$$1-2PdAVex = 2 \times V_{sat} \times 0.25 \times CLOCK \times I_{OH} \times t_2 + 0.25 \times CLOCK \times I_{OH} \times (V_{sat} \times t_1 + V_{df} \times t_3) \text{ ----- (4-2)}$$

W1-2 Phase excitation mode

$$W1-2PdAVex = 0.64 [2 \times V_{sat} \times 0.125 \times CLOCK \times I_{OH} \times t_2 + 0.125 \times CLOCK \times I_{OH} \times (V_{sat} \times t_1 + V_{df} \times t_3)] \text{ ----- (4-3)}$$

2W1-2 Phase excitation mode

$$2W1-2PdAVex = 0.64 [2 \times V_{sat} \times 0.0625 \times CLOCK \times I_{OH} \times t_2 + 0.0625 \times CLOCK \times I_{OH} \times (V_{sat} \times t_1 + V_{df} \times t_3)] \text{ ----- (4-4)}$$

4W1-2 Phase excitation mode

$$4W1-2PdAVex = 0.64 [2 \times V_{sat} \times 0.0625 \times CLOCK \times I_{OH} \times t_2 + 0.0625 \times CLOCK \times I_{OH} \times (V_{sat} \times t_1 + V_{df} \times t_3)] \text{ ----- (4-5)}$$

Motor hold mode

$$HoldPdAVex = 2 \times V_{sat} \times I_{OH} \text{ ----- (4-6)}$$

Note: 2-phase 100% conductance is assumed in Equation (4-6).

V_{sat} : Combined voltage of R_{on} voltage drop + current detection resistance

V_{df} : Combined voltage of the FET body diode + current detection resistance

$CLOCK$: Input $CLOCK$ (HIC: input frequency at Pin 12)

t_1 , t_2 , and t_3 represent the waveforms shown in the figure below.

t_1 : Time required for the winding current to reach the set current (I_{OH})

t_2 : Time in the constant current control (PWM) region

t_3 : Time from end of phase input signal until inverse current regeneration is complete

Motor COM Current Waveform Model

$$t_1 = (-L/(R+0.35)) \ln (1 - ((R+0.35)/V_{CC}) \times I_{OH}) \text{ ----- (4-7)}$$

$$t_3 = (-L/R) \ln ((V_{CC}+0.35)/(I_{OH} \times R + V_{CC}+0.35)) \text{ ----- (4-8)}$$

V_{CC} : Motor supply voltage (V)

L : Motor inductance (H)

R : Motor winding resistance (Ω)

I_{OH} : Motor set output current crest value (A)

Fixed current control time, t_2 , for each excitation mode

- | | |
|---|--|
| (1) 2-phase excitation | $t_2 = (2 \div \text{CLOCK}) - (t_1 + t_3)$(4-9) |
| (2) 1-2 phase excitation | $t_2 = (3 \div \text{CLOCK}) - t_1$(4-10) |
| (3) W1-2 phase excitation | $t_2 = (7 \div \text{CLOCK}) - t_1$(4-11) |
| (4) 2W1-2 phase excitation (and 4W1-2 phase excitation) | $t_2 = (15 \div \text{CLOCK}) - t_1$(4-12) |

For the values of V_{sat} and V_{df} , be sure to substitute from V_{sat} vs I_{OH} and V_{df} vs I_{OH} at the setting current value I_{OH} . (See pages to follow)

Then, determine if a heat sink is necessary by comparing with the ΔT_c vs P_d graph (see next page) based on the calculated average output loss, HIC.

For heat sink design, be sure to see STK672-432B-E.

The HIC average power, P_{dAVex} described above, represents loss when not in avalanche mode. To add the loss in avalanche mode, be sure to add PAVL (4-13, 14) using the formula (3-2) for average power loss, PAVL, for STK672-4** avalanche mode, described below to P_{dAVex} described above.

When using this IC without a fin, always check for temperature increases in the set, because the HIC substrate temperature, T_c , varies due to effects of convection around the HIC.

[Calculating the average power loss, PAVL, during avalanche mode]

The allowable avalanche energy, E_{AVL} , during fixed current chopping operation is represented by Equation (3-2) used to find the average power loss, PAVL, during avalanche mode that is calculated by multiplying Equation (3-1) by the chopping frequency.

$$PAVL = V_{DSS} \times I_{AVL} \times 0.5 \times t_{AVL} \times f_c \dots\dots\dots (3-2)$$

f_c : Hz units (input MAX PWM frequency when using the STK672-4** series.)

Be sure to actually operate an STK672-4** series and substitute values found when observing operations on an oscilloscope for V_{DSS} , I_{AVL} , and t_{AVL} .

The sum of PAVL values for each excitation mode is multiplied by the constants given below and added to the average internal HIC loss equation, except in the case of 2-phase excitation.

$$\text{1-2 excitation mode and higher: } PAVL(1) = 0.7 \times PAVL \dots\dots\dots (4-13)$$

$$\text{During 2-phase excitation and motor hold: } PAVL(1) = 1 \times PAVL \dots\dots\dots (4-14)$$

Output saturation voltage, V_{sat} - Output current, I_{OH}

Forward voltage, V_{df} - Output current, I_{OH}

Substrate temperature rise, ΔT_c (no heat sink) - Internal average power dissipation, P_{dAV}

5. Thermal design

[Operating range in which a heat sink is not used]

Use of a heat sink to lower the operating substrate temperature of the HIC (Hybrid IC) is effective in increasing the quality of the HIC.

The size of heat sink for the HIC varies depending on the magnitude of the average power loss, PdAV, within the HIC. The value of PdAV increases as the output current increases. To calculate PdAV, refer to “Calculating Internal HIC Loss for the STK672-432B-E”.

Calculate the internal HIC loss, PdAV, assuming repeat operation such as shown in Figure 1 below, since conduction during motor rotation and off time both exist during actual motor operations,

Figure 1 Motor Current Timing

T1: Motor rotation operation time

T2: Motor hold operation time

T3: Motor current off time

T2 may be reduced, depending on the application.

T0: Single repeated motor operating cycle

IO1 and IO2: Motor current peak values

Due to the structure of motor windings, the phase current is a positive and negative current with a pulse form.

Note that figure 1 presents the concepts here, and that the on/off duty of the actual signals will differ.

The hybrid IC internal average power dissipation PdAV can be calculated from the following formula.

$$PdAV = (T1 \times P1 + T2 \times P2 + T3 \times 0) \div T0 \quad \text{----- (I)}$$

(Here, P1 is the PdAV for IO1 and P2 is the PdAV for IO2)

If the value calculated using Equation (I) is 1.5W or less, and the ambient temperature, Ta, is 60°C or less, there is no need to attach a heat sink. Refer to Figure 2 for operating substrate temperature data when no heat sink is used.

[Operating range in which a heat sink is used]

Although a heat sink is attached to lower Tc if PdAV increases, the resulting size can be found using the value of θc-a in Equation (II) below and the graph depicted in Figure 3.

$$\theta_{c-a} = (T_c \text{ max} - T_a) \div PdAV \quad \text{----- (II)}$$

Tc max: Maximum operating substrate temperature = 105°C

Ta: HIC ambient temperature

Although a heat sink can be designed based on equations (I) and (II) above, be sure to mount the HIC in a set and confirm that the substrate temperature, Tc, is 105°C or less.

The average HIC power loss, PdAV, described above represents the power loss when there is no avalanche operation.

To add the loss during avalanche operations, be sure to add Equation (3-2), “Allowable STK672-4** Avalanche Energy Value”, to PdAV.

Figure 3 Heat sink area (Board thickness: 2mm) - θ_{c-a}

6. Mitigated Curve of Package Power Loss, PdPK, vs. Ambient Temperature, Ta

Package power loss, PdPK, refers to the average internal power loss, PdAV, allowable without a heat sink. The figure below represents the allowable power loss, PdPK, vs. fluctuations in the ambient temperature, Ta. Power loss of up to 2.8W is allowable at Ta=25°C, and of up to 1.5W at Ta=60°C.

* The package thermal resistance θ_{c-a} is 28.6°C/W.

Allowable power dissipation, PdPK (no heat sink) - Ambient temperature, Ta

7. Other Notes on Use

In addition to the “Notes” indicated in the Sample Application Circuit, care should also be given to the following contents during use.

(1) Allowable operating range

Operation of this product assumes use within the allowable operating range. If a supply voltage or an input voltage outside the allowable operating range is applied, an overvoltage may damage the internal control IC or the MOSFET.

If a voltage application mode that exceeds the allowable operating range is anticipated, connect a fuse or take other measures to cut off power supply to the product.

(2) Input pins

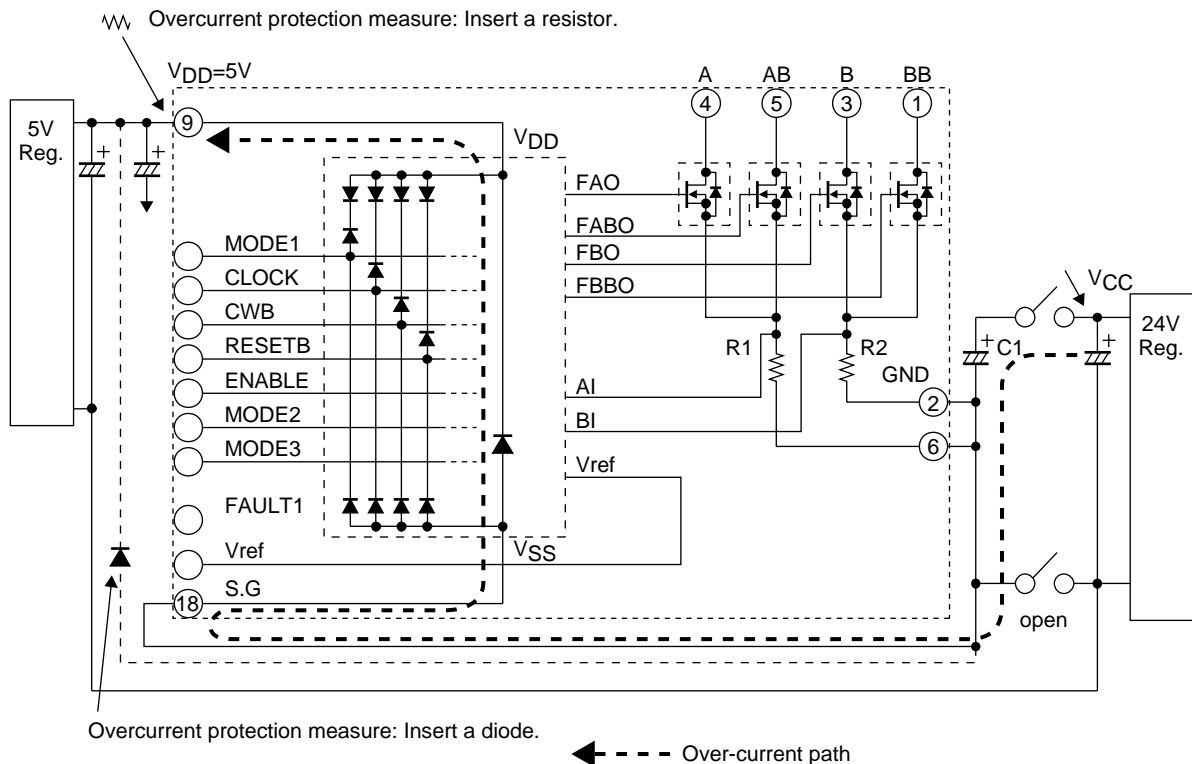

If the input pins are connected directly to the PC board connectors, electrostatic discharge or other overvoltage outside the specified range may be applied from the connectors and may damage the product. Current generated by this overvoltage can be suppressed to effectively prevent damage by inserting 100Ω to 1kΩ resistors in lines connected to the input pins.

Take measures such as inserting resistors in lines connected to the input pins.

(3) Power connectors

If the motor power supply V_{CC} is applied by mistake without connecting the GND part of the power connector when the product is operated, such as for test purposes, an overcurrent flows through the V_{CC} decoupling capacitor, C1, to the parasitic diode between the V_{DD} of the internal control IC and GND, and may damage the power supply pin block of the internal control IC.

To prevent damage in this case, connect a 10Ω resistor to the V_{DD} pin, or insert a diode between the V_{CC} decoupling capacitor C1 GND and the V_{DD} pin.

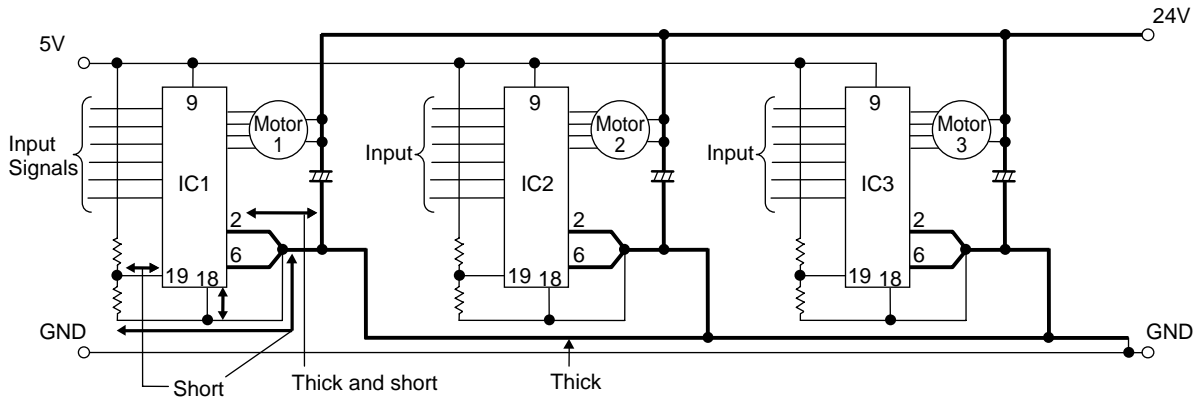

(4) Input Signal Lines

- 1) Do not use an IC socket to mount the driver, and instead solder the driver directly to the PC board to minimize fluctuations in the GND potential due to the influence of the resistance component and inductance component of the GND pattern wiring.
- 2) To reduce noise caused by electromagnetic induction to small signal lines, do not design small signal lines (sensor signal lines, and 5V or 3.3V power supply signal lines) that run parallel in close proximity to the motor output line A (Pin 4), AB (Pin 5), B (Pin 3), or BB (Pin 1) phases.

(5) When mounting multiple drivers on a single PC board

When mounting multiple drivers on a single PC board, the GND design should mount a V_{CC} decoupling capacitor, C1, for each driver to stabilize the GND potential of the other drivers. The key wiring points are as follows.

(6) V_{CC} operating limit

When the output (for example F1) of a 2-phase stepping motor driver is turned OFF, the AB phase back electromotive force eab produced by current flowing to the paired F2 parasitic diode is induced in the F1 side, causing the output voltage VFB to become twice or more the V_{CC} voltage. This is expressed by the following formula.

$$V_{FB} = V_{CC} + e_{ab}$$

$$= V_{CC} + V_{CC} + I_{OH} \times R_M + V_{df} (1.5 V)$$

V_{CC} : Motor supply voltage, I_{OH} : Motor current set by V_{ref}

V_{df} : Voltage drop due to F2 parasitic diode and current detection resistor R1, R_M : Motor winding resistance value

Using the above formula, make sure that VFB is always less than the MOSFET withstand voltage of 100V. This is because there is a possibility that operating limit of V_{CC} falls below the allowable operating range of 46V, due to the R_M and I_{OH} specifications.

The oscillating voltage in excess of VFB is caused by LCRM (inductance, capacitor, resistor, mutual inductance) oscillation that includes micro capacitors C, not present in the circuit. Since M is affected by the motor characteristics, there is some difference in oscillating voltage according to the motor specifications. In addition, constant voltage drive without constant current drive enables motor rotation at $V_{CC} \geq 0V$.
