No.09049EAT07

● Description

Low Voltage CMOS Op-Amp integrate one or two independent output full swing Op-Amps and phase compensation capacitors on a single chip. Especially, this series is operable with low voltage, low supply current and low input bias current.

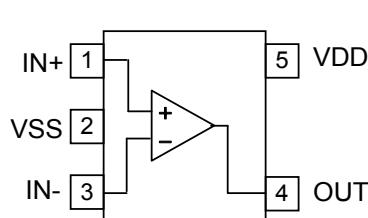

- Input-Output Full Swing : BU7261/BU7241 family , BU7262/BU7242 family
- Ground Sense : BU7461/BU7441 family , BU7462/BU7442 family

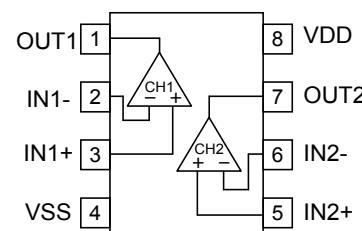

● Features

- 1) Operable with low voltage
 - Input-Output Full Swing : +1.8 [V]~+5.5 [V] (single supply): BU7261/BU7241 family , BU7262/BU7242 family
 - Ground Sense : +1.7 [V]~+5.5 [V] (single supply): BU7461/BU7441 family , BU7462/BU7442 family
- 2) Internal phase compensation
- 3) High large signal voltage gain
- 4) Internal ESD protection
 - Human body model (HBM) ±4000[V] (Typ.)
- 5) Low input bias current 1[pA] (Typ.)

● Pin Assignments

● Absolute maximum rating($T_a=25[^\circ C]$)

Parameter	Symbol	Rating		Unit
		BU7261G, BU7262 F/FVM BU7241G, BU7242 F/FVM BU7461G, BU7462 F/FVM BU7441G, BU7442 F/FVM	BU7261SG, BU7262S F/FVM BU7241SG, BU7242S F/FVM BU7461SG, BU7462S F/FVM BU7441SG, BU7442S F/FVM	
Supply Voltage	VDD-VSS	+7		V
Differential Input Voltage(*1)	Vid	VDD-VSS		V
Input Common-mode Voltage Range	Vicm	(VSS-0.3)~(VDD+0.3)		V
Operating Temperature	Topr	-40~+85	-40~+105	°C
Storage Temperature	Tstg	-55~+125		°C
Maximum Junction Temperature	Tjmax	+125		°C

Note: Absolute maximum rating item indicates the condition which must not be exceeded.

Application of voltage in excess of absolute maximum rating or use out absolute maximum rated temperature environment may cause deterioration of characteristics.

(*1) The voltage difference between inverting input and non-inverting input is the differential input voltage.

Then input terminal voltage is set to more than VSS.

- Examples of circuit
- Voltage follower

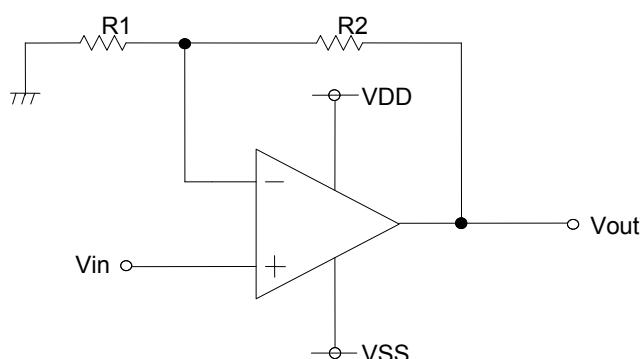

Voltage gain is 0 [dB].
 This circuit controls output voltage (V_{out}) equal input voltage (V_{in}), and keeps V_{out} with stable because of high input impedance and low output impedance.
 V_{out} is shown next formula.
 $V_{out}=V_{in}$

- Inverting amplifier

For inverting amplifier, V_{in} is amplified by voltage gain decided R_1 and R_2 , and phase reversed voltage is outputed.
 V_{out} is shown next formula.
 $V_{out}=-(R_2/R_1) \cdot V_{in}$
 Input impedance is R_1 .

- Non-inverting amplifier

For non-inverting amplifier, V_{in} is amplified by voltage gain decided R_1 and R_2 , and phase is same with V_{in} .
 V_{out} is shown next formula.
 $V_{out}=(1+R_2/R_1) \cdot V_{in}$
 This circuit realizes high input impedance because Input impedance is operational amplifier's input Impedance.

● Description of electrical characteristics

Described here are the terms of electric characteristics used in this technical note. Items and symbols used are also shown. Note that item name and symbol and their meaning may differ from those on another manufacturer's document or general document.

1. Absolute maximum ratings

Absolute maximum rating item indicates the condition which must not be exceeded. Application of voltage in excess of absolute maximum rating or use out of absolute maximum rated temperature environment may cause deterioration of characteristics.

1.1 Power supply voltage (VDD/VSS)

Indicates the maximum voltage that can be applied between the positive power supply terminal and negative power supply terminal without deterioration or destruction of characteristics of internal circuit.

1.2 Differential input voltage (Vid)

Indicates the maximum voltage that can be applied between non-inverting terminal and inverting terminal without deterioration and destruction of characteristics of IC.

1.3 Input common-mode voltage range (Vicm)

Indicates the maximum voltage that can be applied to non-inverting terminal and inverting terminal without deterioration or destruction of characteristics. Input common-mode voltage range of the maximum ratings not assure normal operation of IC. When normal operation of IC is desired, the input common-mode voltage of characteristics item must be followed.

1.4 Power dissipation (Pd)

Indicates the power that can be consumed by specified mounted board at the ambient temperature 25°C(normal temperature). As for package product, Pd is determined by the temperature that can be permitted by IC chip in the package(maximum junction temperature) and thermal resistance of the package.

2. Electrical characteristics item**2.1 Input offset voltage (Vio)**

Indicates the voltage difference between non-inverting terminal and inverting terminal. It can be translated into the input voltage difference required for setting the output voltage at 0 [V].

2.2 Input offset current (lio)

Indicates the difference of input bias current between non-inverting terminal and inverting terminal.

2.3 Input bias current (lb)

Indicates the current that flows into or out of the input terminal. It is defined by the average of input bias current at non-inverting terminal and input bias current at inverting terminal.

2.4 Circuit current (ICC)

Indicates the IC current that flows under specified conditions and no-load steady status.

2.5 High level output voltage / Low level output voltage(VOH/VOL)

Indicates the voltage range that can be output by the IC under specified load condition. It is typically divided into high-level output voltage and low-level output voltage. High-level output voltage indicates the upper limit of output voltage. Low-level output voltage indicates the lower limit.

2.6 Large signal voltage gain (AV)

Indicates the amplifying rate (gain) of output voltage against the voltage difference between non-inverting terminal and inverting terminal. It is normally the amplifying rate (gain) with reference to DC voltage.

$$Av = (\text{Output voltage fluctuation}) / (\text{Input offset fluctuation})$$

2.7 Input common-mode voltage range (Vicm)

Indicates the input voltage range where IC operates normally.

2.8 Common-mode rejection ratio (CMRR)

Indicates the ratio of fluctuation of input offset voltage when in-phase input voltage is changed. It is normally the fluctuation of DC. CMRR = (Change of Input common-mode voltage)/(Input offset fluctuation)

2.9 Power supply rejection ratio (PSRR)

Indicates the ratio of fluctuation of input offset voltage when supply voltage is changed. It is normally the fluctuation of DC. PSRR = (Change of power supply voltage)/(Input offset fluctuation)

2.10 Channel separation(CS)

Indicates the fluctuation of input offset voltage or that of output voltage with reference to the change of output voltage of driven channel.

2.11 Slew rate (SR)

Indicates the time fluctuation ratio of voltage output when step input signal is applied.

2.12 Unity gain frequency (ft)

Indicates a frequency where the voltage gain of Op-Amp is 1.

2.13 Total harmonic distortion + Noise (THD+N)

Indicates the fluctuation of input offset voltage or that of output voltage with reference to the change of output voltage of driven channel.

2.14 Input referred noise voltage (Vn)

Indicates a noise voltage generated inside the operational amplifier equivalent by ideal voltage source connected in series with input terminal.

●Derating curve

Power dissipation (total loss) indicates the power that can be consumed by IC at $T_a=25^{\circ}\text{C}$ (normal temperature).

IC is heated when it consumed power, and the temperature of IC chip becomes higher than ambient temperature.

The temperature that can be accepted by IC chip depends on circuit configuration, manufacturing process, and consumable power is limited.

Power dissipation is determined by the temperature allowed in IC chip (maximum junction temperature) and thermal resistance of package (heat dissipation capability).

The maximum junction temperature is typically equal to the maximum value in the storage package (heat dissipation capability).

The maximum junction temperature is typically equal to the maximum value in the storage temperature range. Heat generated by consumed power of IC radiates from the mold resin or lead frame of the package.

The parameter which indicates this heat dissipation capability (hardness of heat release) is called thermal resistance, represented by the symbol θ_{ja} [$^{\circ}\text{C}/\text{W}$].

The temperature of IC inside the package can be estimated by this thermal resistance.

Fig.190 (a) shows the model of thermal resistance of the package. Thermal resistance θ_{ja} , ambient temperature T_a , junction temperature T_j , and power dissipation P_d can be calculated by the equation below :

$$\theta_{ja} = (T_j - T_a) / P_d \quad [^{\circ}\text{C}/\text{W}] \quad \dots \quad (I)$$

Derating curve in Fig.190(b) indicates power that can be consumed by IC with reference to ambient temperature.

Power that can be consumed by IC begins to attenuate at certain ambient temperature.

This gradient is determined by thermal resistance θ_{ja} . Thermal resistance θ_{ja} depends on chip size, power consumption, package, ambient temperature, package condition, wind velocity, etc even when the same of package is used.

Thermal reduction curve indicates a reference value measured at a specified condition. Fig191(c)-(f) show a derating curve for an example of BU7261/41family,BU7262/42family.,7461/7441family,7462/7442family.

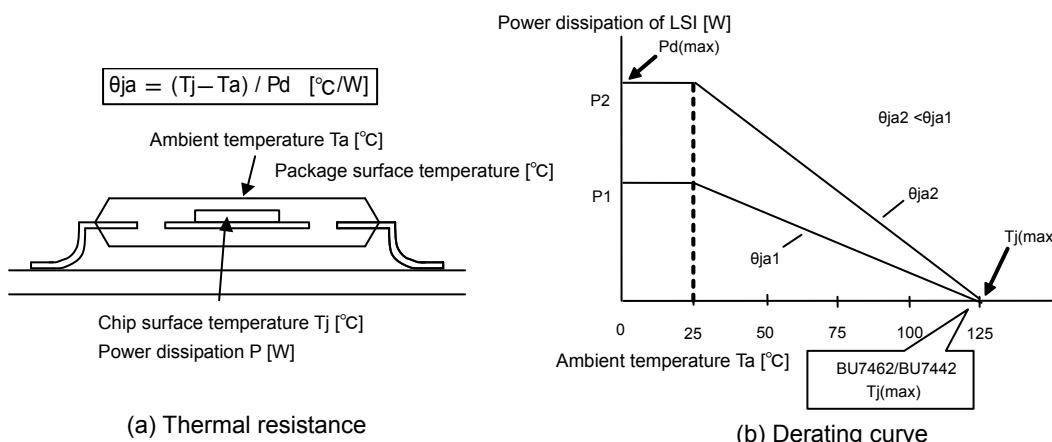

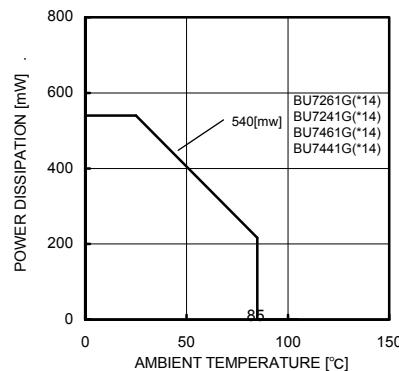

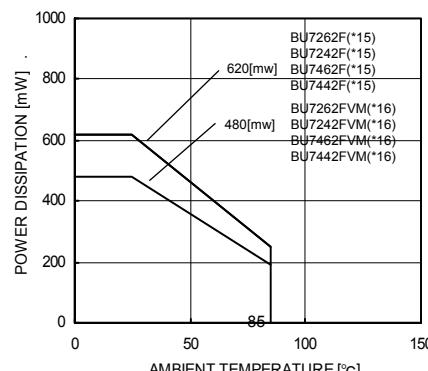

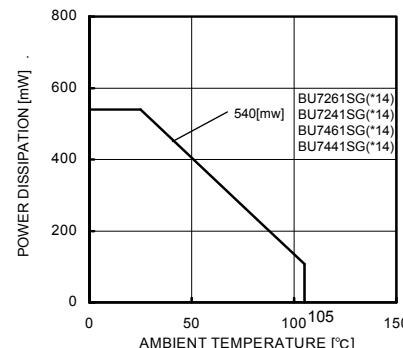

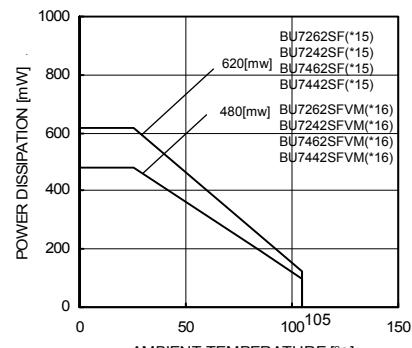

Fig. 190 Thermal resistance and derating

(*14)	(*15)	(*16)	Unit
5.4	6.2	4.8	[mW/°C]

When using the unit above $T_a=25[^\circ\text{C}]$, subtract the value above per degree $[^\circ\text{C}]$. Permissible dissipation is the value when FR4 glass epoxy board $70[\text{mm}] \times 70[\text{mm}] \times 1.6[\text{mm}]$ (cooper foil area below 3[%]) is mounted.

Fig. 191 Derating Curve

●Cautions on use**1) Absolute maximum ratings**

Absolute maximum ratings are the values which indicate the limits,within which the given voltage range can be safely charged to the terminal.However, it does not guarantee the circuit operation.

2) Applied voltage to the input terminal

For normal circuit operation of voltage comparator, please input voltage for itsinput terminal within input common mode voltage $VDD+0.3[V]$.

Then, regardless of power supply voltage, $VSS-0.3[V]$ can be applied to input terminals without deterioration or destruction of its characteristics.

3) Operating power supply (split power supply/single power supply)

The voltage comparator operates if a given level of voltage is applied between VDD and VSS .

Therefore, the operational amplifier can be operated under single power supply or split power supply.

4) Power dissipation (pd)

If the IC is used under excessive power dissipation. An increase in the chip temperature will cause deterioration of the radical characteristics of IC.

For example, reduction of current capability. Take consideration of the effective power dissipation and thermal design with a sufficient margin. Pd is reference to the provided power dissipation curve.

5) Short circuits between pins and incorrect mounting

Short circuits between pins and incorrect mounting when mounting the IC on a printed circuits board, take notice of the direction and positioning of the IC.

If IC is mounted erroneously, It may be damaged. Also, when a foreign object is inserted between output, between output and VDD terminal or VSS terminal which causes short circuit, the IC may be damaged.

6) Using under strong electromagnetic field

Be careful when using the IC under strong electromagnetic field because it may malfunction.

7) Usage of IC

When stress is applied to the IC through warp of the printed circuit board, The characteristics may fluctuate due to the piezo effect. Be careful of the warp of the printed circuit board.

8) Testing IC on the set board

When testing IC on the set board, in cases where the capacitor is connected to the low impedance,make sure to discharge per fabrication because there is a possibility that IC may be damaged by stress.

When removing IC from the set board, it is essential to cut supply voltage.As a countermeasure against the static electricity, observe proper grounding during fabrication process and take due care when carrying and storage it.

9) The IC destruction caused by capacitive load

The transistors in circuits may be damaged when VDD terminal and VSS terminal is shorted with the charged output terminal capacitor.When IC is used as a operational amplifier or as an application circuit,where oscillation is not activated by an output capacitor,the output capacitor must be kept below $0.1[\mu F]$ in order to prevent the damage mentioned above.

10)Decoupling capacitor

Insert the decoupling capacitance between VDD and VSS , for stable operation of operational amplifier.

11)Latch up

Be careful of input voltage that exceed the VDD and VSS . When CMOS device have sometimes occur latch up operation. And protect the IC from abnormaly noise

Notes

No copying or reproduction of this document, in part or in whole, is permitted without the consent of ROHM Co.,Ltd.

The content specified herein is subject to change for improvement without notice.

The content specified herein is for the purpose of introducing ROHM's products (hereinafter "Products"). If you wish to use any such Product, please be sure to refer to the specifications, which can be obtained from ROHM upon request.

Examples of application circuits, circuit constants and any other information contained herein illustrate the standard usage and operations of the Products. The peripheral conditions must be taken into account when designing circuits for mass production.

Great care was taken in ensuring the accuracy of the information specified in this document. However, should you incur any damage arising from any inaccuracy or misprint of such information, ROHM shall bear no responsibility for such damage.

The technical information specified herein is intended only to show the typical functions of and examples of application circuits for the Products. ROHM does not grant you, explicitly or implicitly, any license to use or exercise intellectual property or other rights held by ROHM and other parties. ROHM shall bear no responsibility whatsoever for any dispute arising from the use of such technical information.

The Products specified in this document are intended to be used with general-use electronic equipment or devices (such as audio visual equipment, office-automation equipment, communication devices, electronic appliances and amusement devices).

The Products specified in this document are not designed to be radiation tolerant.

While ROHM always makes efforts to enhance the quality and reliability of its Products, a Product may fail or malfunction for a variety of reasons.

Please be sure to implement in your equipment using the Products safety measures to guard against the possibility of physical injury, fire or any other damage caused in the event of the failure of any Product, such as derating, redundancy, fire control and fail-safe designs. ROHM shall bear no responsibility whatsoever for your use of any Product outside of the prescribed scope or not in accordance with the instruction manual.

The Products are not designed or manufactured to be used with any equipment, device or system which requires an extremely high level of reliability the failure or malfunction of which may result in a direct threat to human life or create a risk of human injury (such as a medical instrument, transportation equipment, aerospace machinery, nuclear-reactor controller, fuel-controller or other safety device). ROHM shall bear no responsibility in any way for use of any of the Products for the above special purposes. If a Product is intended to be used for any such special purpose, please contact a ROHM sales representative before purchasing.

If you intend to export or ship overseas any Product or technology specified herein that may be controlled under the Foreign Exchange and the Foreign Trade Law, you will be required to obtain a license or permit under the Law.
