\*The  $V_{\text{DD}}$  and  $V_{\text{DDQ}}$  pins are tied common to a single power-plane on these designs.

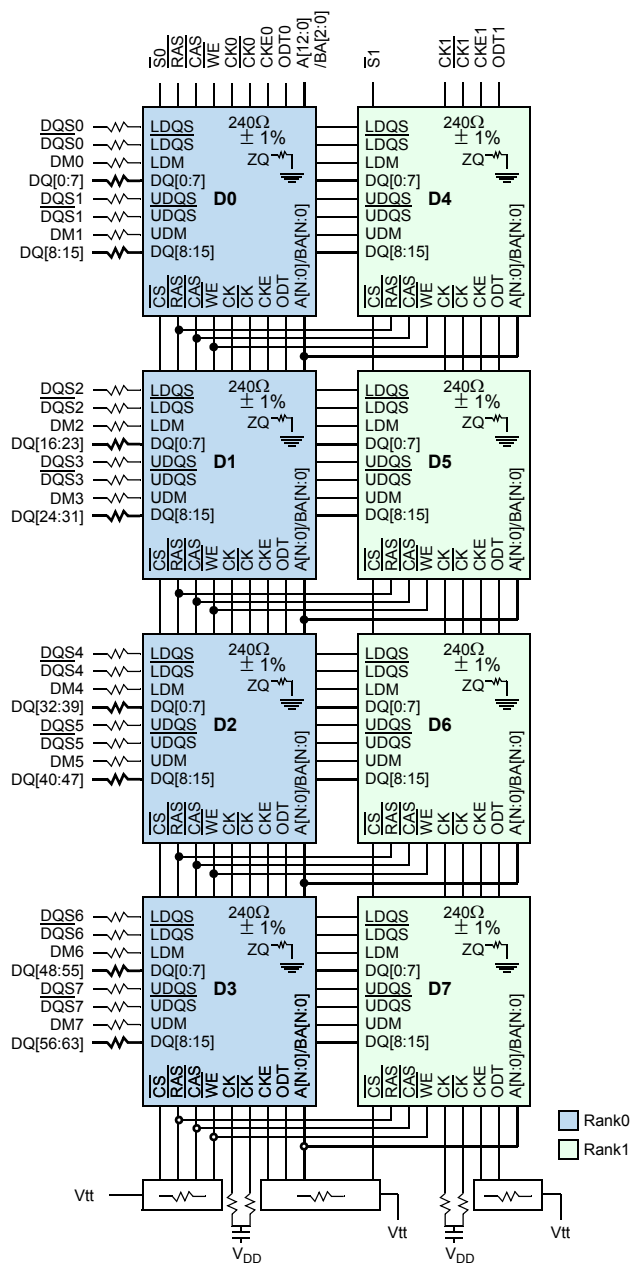

## 6.0 Input/Output Functional Description

Symbol	Type	Function
CK0-CK1 CK0-CK1	Input	The system clock inputs. All address and command lines are sampled on the cross point of the rising edge of CK and falling edge of CK. A Delay Locked Loop (DLL) circuit is driven from the clock inputs and output timing for read operations is synchronized to the input clock.
CKE0-CKE1	Input	Activates the DDR3 SDRAM CK signal when high and deactivates the CK signal when low. By deactivating the clocks, CKE low initiates the Power Down mode or the Self Refresh mode.
$\overline{S0}$ - $\overline{S1}$	Input	Enables the associated DDR3 SDRAM command decoder when low and disables the command decoder when high. When the command decoder is disabled, new commands are ignored but previous operations continue. Rank 0 is selected by $\overline{S0}$ ; Rank 1 is selected by $\overline{S1}$ .
$\overline{RAS}$ , $\overline{CAS}$ , $\overline{WE}$	Input	When sampled at the cross point of the rising edge of CK and falling edge of $\overline{CK}$ , signals $\overline{CAS}$ , $\overline{RAS}$ , and $\overline{WE}$ define the operation to be executed by the SDRAM.
BA0-BA2	Input	Selects which DDR3 SDRAM internal bank of eight is activated.
ODT0-ODT1	Input	Asserts on-die termination for DQ, DM, DQS, and DQS signals if enabled via the DDR3 SDRAM mode register.
A0-A9, A10/AP, A11 A12/BC A13-A15	Input	During a Bank Activate command cycle, defines the row address when sampled at the cross point of the rising edge of CK and falling edge of CK. During a Read or Write command cycle, defines the column address when sampled at the cross point of the rising edge of CK and falling edge of CK. In addition to the column address, AP is used to invoke autoprecharge operation at the end of the burst read or write cycle. If AP is high, autoprecharge is selected and BA0-BAn defines the bank to be precharged. If AP is low, autoprecharge is disabled. During a Precharge command cycle, AP is used in conjunction with BA0-BAn to control which bank(s) to precharge. If AP is high, all banks will be precharged regardless of the state of BA0-BAn inputs. If AP is low, then BA0-BAn are used to define which bank to precharge. A12(BC) is sampled during READ and WRITE commands to determine if burst chop (on-the fly) will be performed (HIGH, no burst chop; LOW, burst chopped)
DQ0-DQ63	I/O	Data Input/Output pins.
DM0-DM7	Input	The data write masks, associated with one data byte. In Write mode, DM operates as a byte mask by allowing input data to be written if it is low but blocks the write operation if it is high. In Read mode, DM lines have no effect.
DQS0-DQS7 $\overline{DQS0}$ - $\overline{DQS7}$	I/O	The data strobes, associated with one data byte, sourced with data transfers. In Write mode, the data strobe is sourced by the controller and is centered in the data window. In Read mode, the data strobe is sourced by the DDR3 SDRAMs and is sent at the leading edge of the data window. $\overline{DQS}$ signals are complements, and timing is relative to the crosspoint of respective DQS and $\overline{DQS}$ .
$V_{DD}$ , $V_{DDSPD}$ , $V_{SS}$	Supply	Power supplies for core, I/O, Serial Presence Detect, Temp sensor, and ground for the module.
$V_{REFDQ}$ , $V_{REFCA}$	Supply	Reference voltage for SSTL15 inputs.
SDA	I/O	This is a bidirectional pin used to transfer data into or out of the SPD EEPROM and Temp sensor. A resistor must be connected from the SDA bus line to $V_{DDSPD}$ on the system planar to act as a pull up.
SCL	Input	This signal is used to clock data into and out of the SPD EEPROM and Temp sensor.
SA0-SA1	Input	Address pins used to select the Serial Presence Detect and Temp sensor base address.
TEST	I/O	The TEST pin is reserved for bus analysis tools and is not connected on normal memory modules
$\overline{RESET}$	Input	$\overline{RESET}$ In Active Low This signal resets the DDR3 SDRAM

## 8.0 Absolute Maximum Ratings

### 8.1 Absolute Maximum DC Ratings

Symbol	Parameter	Rating	Units	Notes
$V_{DD}$	Voltage on $V_{DD}$ pin relative to $V_{SS}$	-0.4 V ~ 1.975 V	V	1,3
$V_{DDQ}$	Voltage on $V_{DDQ}$ pin relative to $V_{SS}$	-0.4 V ~ 1.975 V	V	1,3
$V_{IN}, V_{OUT}$	Voltage on any pin relative to $V_{SS}$	-0.4 V ~ 1.975 V	V	1
$T_{STG}$	Storage Temperature	-55 to +100	°C	1, 2

Note :

- Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- Storage Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD51-2 standard.
- $V_{DD}$  and  $V_{DDQ}$  must be within 300mV of each other at all times; and  $V_{REF}$  must be not greater than  $0.6 \times V_{DDQ}$ . When  $V_{DD}$  and  $V_{DDQ}$  are less than 500mV;  $V_{REF}$  may be equal to or less than 300mV.

### 8.2 DRAM Component Operating Temperature Range

Symbol	Parameter	rating	Unit	Notes
$T_{OPER}$	Operating Temperature Range	0 to 95	°C	1, 2, 3

Note :

- Operating Temperature  $T_{OPER}$  is the case surface temperature on the center/top side of the DRAM. For measurement conditions, please refer to the JEDEC document JESD51-2.
- The Normal Temperature Range specifies the temperatures where all DRAM specifications will be supported. During operation, the DRAM case temperature must be maintained between 0-85°C under all operating conditions
- Some applications require operation of the Extended Temperature Range between 85°C and 95°C case temperature. Full specifications are guaranteed in this range, but the following additional conditions apply:
  - Refresh commands must be doubled in frequency, therefore reducing the refresh interval  $t_{REFI}$  to 3.9us. It is also possible to specify a component with 1X refresh ( $t_{REFI}$  to 7.8us) in the Extended Temperature Range.
  - If Self-Refresh operation is required in the Extended Temperature Range, then it is mandatory to either use the Manual Self-Refresh mode with Extended Temperature Range capability (MR2 A6 = 0b and MR2 A7 = 1b) or enable the optional Auto Self-Refresh mode (MR2 A6 = 1b and MR2 A7 = 0b)

## 9.0 AC & DC Operating Conditions

### 9.1 Recommended DC Operating Conditions (SSTL-15)

Symbol	Parameter	Rating			Units	Notes
		Min.	Typ.	Max.		
$V_{DD}$	Supply Voltage	1.425	1.5	1.575	V	1,2
$V_{DDQ}$	Supply Voltage for Output	1.425	1.5	1.575	V	1,2

Note :

- Under all conditions  $V_{DDQ}$  must be less than or equal to  $V_{DD}$ .
- $V_{DDQ}$  tracks with  $V_{DD}$ . AC parameters are measured with  $V_{DD}$  and  $V_{DDQ}$  tied together.

## 10.0 AC & DC Input Measurement Levels

### 10.1 AC & DC Logic Input Levels for Single-ended Signals

Single Ended AC and DC input levels for Command and Address

Symbol	Parameter	DDR3-800/1066		DDR3-1333		Unit	Notes
		Min.	Max.	Min.	Max.

  2. See "Overshoot and Undershoot specifications" section.
  3. The AC peak noise on  $V_{REF}$  may not allow  $V_{REF}$  to deviate from  $V_{REF}(DC)$  by more than  $\pm 1\% V_{DD}$  (for reference : approx.  $\pm 15mV$ )
  4. For reference : approx.  $V_{DD}/2 \pm 15mV$
  5. Single ended swing requirement for DQS -  $\overline{DQS}$  is 350mV (peak to peak). Differential swing requirement for DQS -  $\overline{DQS}$  is 700mV (peak to peak).

## 10.2 $V_{REF}$ Tolerances.

The dc-tolerance limits and ac-noise limits for the reference voltages  $V_{REFCA}$  and  $V_{REFDQ}$  are illustrate in Figure 1. It shows a valid reference voltage  $V_{REF}(t)$  as a function of time. ( $V_{REF}$  stands for  $V_{REFCA}$  and  $V_{REFDQ}$  likewise).

$V_{REF}(DC)$  is the linear average of  $V_{REF}(t)$  over a very long period of time (e.g. 1 sec). This average has to meet the min/max requirements of  $V_{REF}$ . Furthermore  $V_{REF}(t)$  may temporarily deviate from  $V_{REF}(DC)$  by no more than  $\pm 1\% V_{DD}$ .

Figure 1. Illustration of  $V_{REF}(DC)$  tolerance and  $V_{REF}$  ac-noise limits

The voltage levels for setup and hold time measurements  $V_{IH}(AC)$ ,  $V_{IH}(DC)$ ,  $V_{IL}(AC)$  and  $V_{IL}(DC)$  are dependent on  $V_{REF}$ .

" $V_{REF}$ " shall be understood as  $V_{REF}(DC)$ , as defined in Figure 1.

This clarifies, that dc-variations of  $V_{REF}$  affect the absolute voltage a signal has to reach to achieve a valid high or low level and therefore the time to which setup and hold is measured. System timing and voltage budgets need to account for  $V_{REF}(DC)$  deviations from the optimum position within the data-eye of the input signals.

This also clarifies that the DRAM setup/hold specification and derating values need to include time and voltage associated with  $V_{REF}$  ac-noise. Timing and voltage effects due to ac-noise on  $V_{REF}$  up to the specified limit ( $\pm 1\%$  of  $V_{DD}$ ) are included in DRAM timings and their associated deratings.

Notes:

- Used to define a differential signal slew-rate.
- for CK -  $\overline{\text{CK}}$  use  $V_{IH}/V_{IL}(AC)$  of ADD/CMD and  $V_{REFCA}$ ; for DQS -  $\overline{\text{DQS}}$ , DQSL -  $\overline{\text{DQSL}}$ , DQSU -  $\overline{\text{DQSU}}$  use  $V_{IH}/V_{IL}(AC)$  of DQs and  $V_{REFDQ}$ ; if a reduced ac-high or ac-low level is used for a signal group, then the reduced level applies also here.
- These values are not defined, however they single-ended signals CK,  $\overline{\text{CK}}$ , DQS,  $\overline{\text{DQS}}$ , DQSL,  $\overline{\text{DQSL}}$ , DQSU,  $\overline{\text{DQSU}}$  need to be within the respective limits ( $V_{IH}(DC)$  max,  $V_{IL}(DC)$  min) for single-ended signals as well as the limitations for overshoot and undershoot. ## 10.3.3 Single-ended Requirements for Differential Signals

Each individual component of a differential signal (CK, DQS, DQSL, DQSU,  $\overline{\text{CK}}$ ,  $\overline{\text{DQS}}$ ,  $\overline{\text{DQSL}}$ , or  $\overline{\text{DQSU}}$ ) has also to comply with certain requirements for single-ended signals.

CK and  $\overline{\text{CK}}$  have to approximately reach  $V_{\text{SEHmin}} / V_{\text{SELmax}}$  (approximately equal to the ac-levels ( $V_{\text{IH}}(\text{AC}) / V_{\text{IL}}(\text{AC})$ ) for ADD/CMD signals) in every half-cycle.

DQS, DQSL, DQSU,  $\overline{\text{DQS}}$ ,  $\overline{\text{DQSL}}$  have to reach  $V_{\text{SEHmin}} / V_{\text{SELmax}}$  (approximately the ac-levels ( $V_{\text{IH}}(\text{AC}) / V_{\text{IL}}(\text{AC})$ ) for DQ signals) in every half-cycle proceeding and following a valid transition.

Note that the applicable ac-levels for ADD/CMD and DQ's might be different per speed-bin etc. E.g. if  $V_{\text{IH150}}(\text{AC})/V_{\text{IL150}}(\text{AC})$  is used for ADD/CMD signals, then these ac-levels apply also for the single-ended signals CK and  $\overline{\text{CK}}$ .

Figure 3. Single-ended requirement for differential signals

Note that while ADD/CMD and DQ signal requirements are with respect to  $V_{\text{REF}}$ , the single-ended components of differential signals have a requirement with respect to  $V_{\text{DD}}/2$ ; this is nominally the same. The transition of single-ended signals through the ac-levels is used to measure setup time. For single-ended components of differential signals the requirement to reach  $V_{\text{SELmax}}$ ,  $V_{\text{SEHmin}}$  has no bearing on timing, but adds a restriction on the common mode characteristics of these signals.

### Single ended levels for CK, DQS, DQSL, DQSU, $\overline{\text{CK}}$ , $\overline{\text{DQS}}$ , $\overline{\text{DQSL}}$ or $\overline{\text{DQSU}}$

Symbol	Parameter	DDR3-800/1066/1333		Unit	Notes
		Min	Max		
$V_{\text{SEH}}$	Single-ended high-level for strobes	$(V_{\text{DD}}/2)+0.175$	Note3	V	1, 2
	Single-ended high-level for CK, $\overline{\text{CK}}$	$(V_{\text{DD}}/2)+0.175$	Note3	V	1, 2
$V_{\text{SEL}}$	Single-ended low-level for strobes	Note3	$(V_{\text{DD}}/2)-0.175$	V	1, 2
	Single-ended low-level for CK, $\overline{\text{CK}}$	Note3	$(V_{\text{DD}}/2)-0.175$	V	1, 2

Notes:

- For CK,  $\overline{\text{CK}}$  use  $V_{\text{IH}}/V_{\text{IL}}(\text{AC})$  of ADD/CMD; for strobes (DQS,  $\overline{\text{DQS}}$ , DQSL,  $\overline{\text{DQSL}}$ , DQSU,  $\overline{\text{DQSU}}$ ) use  $V_{\text{IH}}/V_{\text{IL}}(\text{AC})$  of DQs.
- $V_{\text{IH}}(\text{AC})/V_{\text{IL}}(\text{AC})$  for DQs is based on  $V_{\text{REFDQ}}$ ;  $V_{\text{IH}}(\text{AC})/V_{\text{IL}}(\text{AC})$  for ADD/CMD is based on  $V_{\text{REFCA}}$ ; if a reduced ac-high or ac-low level is used for a signal group, then the reduced level applies also here
- These values are not defined, however the single-ended signals CK,  $\overline{\text{CK}}$ , DQS,  $\overline{\text{DQS}}$ , DQSL,  $\overline{\text{DQSL}}$ , DQSU,  $\overline{\text{DQSU}}$  need to be within the respective limits ( $V_{\text{IH}}(\text{DC})$  max,  $V_{\text{IL}}(\text{DC})$  min) for single-ended signals as well as the limitations for overshoot and undershoot. Refer to "Overshoot and Undershoot Specification"

10.3.4 Differential Input Cross Point Voltage

To guarantee tight setup and hold times as well as output skew parameters with respect to clock and strobe, each cross point voltage of differential input signals (CK,  $\overline{\text{CK}}$  and DQS,  $\overline{\text{DQS}}$ ) must meet the requirements in below table. The differential input cross point voltage  $V_{IX}$  is measured from the actual cross point of true and complement signal to the mid level between of  $V_{DD}$  and  $V_{SS}$ .

Figure 4.  $V_{IX}$  Definition

Cross point voltage for differential input signals (CK, DQS)

Symbol	Parameter	DDR3-800/1066/1333		Unit	Notes
		Min	Max		
$V_{IX}$	Differential Input Cross Point Voltage relative to $V_{DD}/2$ for CK, $\overline{\text{CK}}$	-150	150	mV	
		-175	175	mV	1
$V_{IX}$	Differential Input Cross Point Voltage relative to $V_{DD}/2$ for DQS, $\overline{\text{DQS}}$	-150	150	mV	

Note :  
1. Extended range for  $V_{IX}$  is only allowed for clock and if single-ended clock input signals CK and  $\overline{\text{CK}}$  are monotonic, have a single-ended swing  $V_{SEL} / V_{SEH}$  of at least  $V_{DD}/2 \pm 250$  mV, and the differential slew rate of CK- $\overline{\text{CK}}$  is larger than 3 V/ ns.

See "Data Setup, Hold and Slew Rate Derating" for single-ended slew rate definitions for data signals.

10.5 Slew rate definition for Differential Input Signals

Input slew rate for differential signals (CK,  $\overline{\text{CK}}$  and DQS,  $\overline{\text{DQS}}$ ) are defined and measured as shown in below.

Differential input slew rate definition

Description	Measured		Defined by
	From	To	
Differential input slew rate for rising edge (CK- $\overline{\text{CK}}$ and DQS- $\overline{\text{DQS}}$ )	$V_{ILdiffmax}$	$V_{IHdiffmin}$	$\frac{V_{IHdiffmin} - V_{ILdiffmax}}{\text{Delta TRdiff}}$
Differential input slew rate for falling edge (CK- $\overline{\text{CK}}$ and DQS- $\overline{\text{DQS}}$ )	$V_{IHdiffmin}$	$V_{ILdiffmax}$	$\frac{V_{IHdiffmin} - V_{ILdiffmax}}{\text{Delta TFdiff}}$

Note : The differential signal (i.e. CK -  $\overline{\text{CK}}$  and DQS -  $\overline{\text{DQS}}$ ) must be linear between these thresholds

## 14.3.1 Speed Bin Table Notes

Absolute Specification ( $T_{\text{OPER}}$ ;  $V_{\text{DDQ}} = V_{\text{DD}} = 1.5\text{V} \pm 0.075\text{V}$ );

Note :

1. The CL setting and CWL setting result in  $t_{\text{CK}}(\text{AVG})_{\text{MIN}}$  and  $t_{\text{CK}}(\text{AVG})_{\text{MAX}}$  requirements. When making a selection of  $t_{\text{CK}}(\text{AVG})$ , both need to be fulfilled: Requirements from CL setting as well as requirements from CWL setting.
2.  $t_{\text{CK}}(\text{AVG})_{\text{MIN}}$  limits: Since CAS Latency is not purely analog - data and strobe output are synchronized by the DLL - all possible intermediate frequencies may not be guaranteed. An application should use the next smaller JEDEC standard  $t_{\text{CK}}(\text{AVG})$  value (2.5, 1.875, 1.5, or 1.25 ns) when calculating  $\text{CL} [\text{nCK}] = t_{\text{AA}} [\text{ns}] / t_{\text{CK}}(\text{AVG}) [\text{ns}]$ , rounding up to the next "SupportedCL".
3.  $t_{\text{CK}}(\text{AVG})_{\text{MAX}}$  limits: Calculate  $t_{\text{CK}}(\text{AVG}) = t_{\text{AA}}_{\text{MAX}} / \text{CL SELECTED}$  and round the resulting  $t_{\text{CK}}(\text{AVG})$  down to the next valid speed bin (i.e. 3.3ns or 2.5ns or 1.875 ns or 1.25 ns). This result is  $t_{\text{CK}}(\text{AVG})_{\text{MAX}}$  corresponding to CL SELECTED.
4. "Reserved" settings are not allowed. User must program a different value.
5. "Optional" settings allow certain devices in the industry to support this setting, however, it is not a mandatory feature. Refer to supplier's data sheet and/or the DIMM SPD information if and how this setting is supported.
6. Any DDR3-1066 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
7. Any DDR3-1333 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
8. Any DDR3-1600 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
9. For devices supporting optional downshift to CL=7 and CL=9,  $t_{\text{AA}}/t_{\text{RCD}}/t_{\text{RP}}$  min must be 13.125 ns or lower. SPD settings must be programmed to match. For example, DDR3-1333(CL9) devices supporting downshift to DDR3-1066(CL7) should program 13.125 ns in SPD bytes for  $t_{\text{AAmin}}$  (Byte 16),  $t_{\text{RCDmin}}$  (Byte 18), and  $t_{\text{RPmin}}$  (Byte 20). DDR3-1600(CL11) devices supporting downshift to DDR3-1333(CL9) or DDR3-1066(CL7) should program 13.125 ns in SPD bytes for  $t_{\text{AAmin}}$  (Byte16),  $t_{\text{RCDmin}}$  (Byte 18), and  $t_{\text{RPmin}}$  (Byte 20). Once  $t_{\text{RP}}$  (Byte 20) is programmed to 13.125ns,  $t_{\text{RCmin}}$  (Byte 21,23) also should be programmed accordingly. For example, 49.125ns ( $t_{\text{RASmin}} + t_{\text{RPmin}}=36\text{ns}+13.125\text{ns}$ ) for DDR3-1333(CL9) and 48.125ns ( $t_{\text{RASmin}}+t_{\text{RPmin}}=35\text{ns}+13.125\text{ns}$ ) for DDR3-1600(CL11).

## 15.1 Jitter Notes

- Specific Note a** Unit 'tCK(avg)' represents the actual tCK(avg) of the input clock under operation. Unit 'nCK' represents one clock cycle of the input clock, counting the actual clock edges.ex) tMRD = 4 [nCK] means; if one Mode Register Set command is registered at Tm, another Mode Register Set command may be registered at Tm+4, even if (Tm+4 - Tm) is 4 x tCK(avg) + tERR(4per),min.
- Specific Note b** These parameters are measured from a command/address signal (CKE,  $\overline{CS}$ ,  $\overline{RAS}$ ,  $\overline{CAS}$ ,  $\overline{WE}$ , ODT, BA0, A0, A1, etc.) transition edge to its respective clock signal (CK/ $\overline{CK}$ ) crossing. The spec values are not affected by the amount of clock jitter applied (i.e. tJIT(per), tJIT(cc), etc.), as the setup and hold are relative to the clock signal crossing that latches the command/address. That is, these parameters should be met whether clock jitter is present or not.
- Specific Note c** These parameters are measured from a data strobe signal (DQS(L/U),  $\overline{DQS}$ (L/U)) crossing to its respective clock signal (CK,  $\overline{CK}$ ) crossing. The spec values are not affected by the amount of clock jitter applied (i.e. tJIT(per), tJIT(cc), etc.), as these are relative to the clock signal crossing. That is, these parameters should be met whether clock jitter is present or not.
- Specific Note d** These parameters are measured from a data signal (DM(L/U), DQ(L/U)0, DQ(L/U)1, etc.) transition edge to its respective data strobe signal (DQS(L/U),  $\overline{DQS}$ (L/U)) crossing.
- Specific Note e** For these parameters, the DDR3 SDRAM device supports  $t_nPARAM [nCK] = RU\{ tPARAM [ns] / tCK(avg) [ns] \}$ , which is in clock cycles, assuming all input clock jitter specifications are satisfied. For example, the device will support  $t_nRP = RU\{tRP / tCK(avg)\}$ , which is in clock cycles, if all input clock jitter specifications are met. This means: For DDR3-800 6-6-6, of which tRP = 15ns, the device will support  $t_nRP = RU\{tRP / tCK(avg)\} = 6$ , as long as the input clock jitter specifications are met, i.e. Precharge command at Tm and Active command at Tm+6 is valid even if (Tm+6 - Tm) is less than 15ns due to input clock jitter.
- Specific Note f** When the device is operated with input clock jitter, this parameter needs to be derated by the actual tERR(mper),act of the input clock, where  $2 \leq m \leq 12$ . (output deratings are relative to the SDRAM input clock.)  
For example, if the measured jitter into a DDR3-800 SDRAM has tERR(mper),act,min = - 172 ps and tERR(mper),act,max = + 193 ps, then tDQSCK,min(derated) = tDQSCK,min - tERR(mper),act,max = - 400 ps - 193 ps = - 593 ps and tDQSCK,max(derated) = tDQSCK,max - tERR(mper),act,min = 400 ps + 172 ps = + 572 ps. Similarly, tLZ(DQ) for DDR3-800 derates to tLZ(DQ),min(derated) = - 800 ps - 193 ps = - 993 ps and tLZ(DQ),max(derated) = 400 ps + 172 ps = + 572 ps. (Caution on the min/max usage!)Note that tERR(mper),act,min is the minimum measured value of tERR(nper) where  $2 \leq n \leq 12$ , and tERR(mper),act,max is the maximum measured value of tERR(nper) where  $2 \leq n \leq 12$ .
- Specific Note g** When the device is operated with input clock jitter, this parameter needs to be derated by the actual tJIT(per),act of the input clock. (output deratings are relative to the SDRAM input clock.) For example, if the measured jitter into a DDR3-800 SDRAM has tCK(avg),act = 2500 ps, tJIT(per),act,min = - 72 ps and tJIT(per),act,max = + 93 ps, then tRPRE,min(derated) = tRPRE,min + tJIT(per),act,min = 0.9 x tCK(avg),act + tJIT(per),act,min = 0.9 x 2500 ps - 72 ps = + 2178 ps. Similarly, tQH,min(derated) = tQH,min + tJIT(per),act,min = 0.38 x tCK(avg),act + tJIT(per),act,min = 0.38 x 2500 ps - 72 ps = + 878 ps. (Caution on the min/max usage!)

## 15.2 Timing Parameter Notes

1. Actual value dependant upon measurement level definitions which are TBD.
2. Commands requiring a locked DLL are: READ (and RAP) and synchronous ODT commands.
3. The max values are system dependent.
4. WR as programmed in mode register
5. Value must be rounded-up to next higher integer value
6. There is no maximum cycle time limit besides the need to satisfy the refresh interval, tREFI.
7. For definition of RTT turn-on time tAON see "Device Operation & Timing Diagram Datasheet"
8. For definition of RTT turn-off time tAOF see "Device Operation & Timing Diagram Datasheet".
9. tWR is defined in ns, for calculation of tWRPDEN it is necessary to round up tWR / tCK to the next integer.
10. WR in clock cycles as programmed in MR0
11. The maximum read postamble is bound by tDQSCK(min) plus tQSH(min) on the left side and tHZ(DQS)max on the right side. Device Operation.
12. Output timing deratings are relative to the SDRAM input clock. When the device is operated with input clock jitter, this parameter needs to be derated by TBD
13. Value is only valid for RON34
14. Single ended signal parameter.
15. tREFI depends on T<sub>OPER</sub>
16. tIS(base) and tIH(base) values are for 1V/ns CMD/ADD single-ended slew rate and 2V/ns CK,  $\overline{\text{CK}}$  differential slew rate, Note for DQ and DM signals,  $V_{\text{REF}}(\text{DC}) = V_{\text{REFDQ}}(\text{DC})$ . For input only pins except RESET,  $V_{\text{REF}}(\text{DC}) = V_{\text{REFCA}}(\text{DC})$ . See "Address/ Command Setup, Hold and Derating"
17. tDS(base) and tDH(base) values are for 1V/ns DQ single-ended slew rate and 2V/ns DQS,  $\overline{\text{DQS}}$  differential slew rate. Note for DQ and DM signals,  $V_{\text{REF}}(\text{DC}) = V_{\text{REFDQ}}(\text{DC})$ . For input only pins except RESET,  $V_{\text{REF}}(\text{DC}) = V_{\text{REFCA}}(\text{DC})$ . See "Data Setup, Hold and Slew Rate Derating"
18. Start of internal write transaction is defined as follows :  
For BL8 (fixed by MRS and on-the-fly) : Rising clock edge 4 clock cycles after WL.  
For BC4 (on-the-fly) : Rising clock edge 4 clock cycles after WL.  
For BC4 (fixed by MRS) : Rising clock edge 2 clock cycles after WL
19. The maximum read preamble is bound by tLZDQS(min) on the left side and tDQSCK(max) on the right side. See "Device Operation"
20. CKE is allowed to be registered low while operations such as row activation, precharge, autoprecharge or refresh are in progress, but power-down IDD spec will not be applied until finishing those operations.
21. Although CKE is allowed to be registered LOW after a REFRESH command once tREFPDEN(min) is satisfied, there are cases where additional time such as tXPDLL(min) is also required. See "Device Operation".
22. Defined between end of MPR read burst and MRS which reloads MPR or disables MPR function.
23. One ZQCS command can effectively correct a minimum of 0.5 % (ZQCorrection) of RON and RTT impedance error within 64 nCK for all speed bins assuming the maximum sensitivities specified in the 'Output Driver Voltage and Temperature Sensitivity' and 'ODT Voltage and Temperature Sensitivity' tables. The appropriate interval between ZQCS commands can be determined from these tables and other application specific parameters. One method for calculating the interval between ZQCS commands, given the temperature (Tdfrate) and voltage (Vdfrate) drift rates that the SDRAM is subject to in the application, is illustrated. The interval could be defined by the following formula:

$$\frac{\text{ZQCorrection}}{(\text{TSens} \times \text{Tdfrate}) + (\text{VSens} \times \text{Vdfrate})}$$

where TSens = max(dRTTdT, dRONdTM) and VSens = max(dRTTdV, dRONdVM) define the SDRAM temperature and voltage sensitivities.

For example, if TSens = 1.5% / °C, VSens = 0.15% / mV, Tdfrate = 1°C / sec and Vdfrate = 15 mV / sec, then the interval between ZQCS commands is calculated as:

$$\frac{0.5}{(1.5 \times 1) + (0.15 \times 15)} = 0.133 \approx 128\text{ms}$$

24. n = from 13 cycles to 50 cycles. This row defines 38 parameters.
25. tCH(abs) is the absolute instantaneous clock high pulse width, as measured from one rising edge to the following falling edge.
26. tCL(abs) is the absolute instantaneous clock low pulse width, as measured from one falling edge to the following rising edge.
27. The tIS(base) AC150 specifications are adjusted from the tIS(base) specification by adding an additional 100 ps of derating to accommodate for the lower alternate threshold of 150 mV and another 25 ps to account for the earlier reference point [(175 mV - 150 mV) / 1 V/ns].
28. Pulse width of a input signal is defined as the width between the first crossing of V<sub>REF</sub>(DC) and the consecutive crossing of V<sub>REF</sub>(DC)
29. tDQSL describes the instantaneous differential input low pulse width on DQS- $\overline{\text{DQS}}$ , as measured from one falling edge to the next consecutive rising edge.
30. tDQSH describes the instantaneous differential input high pulse width on DQS- $\overline{\text{DQS}}$ , as measured from one rising edge to the next consecutive falling edge.
31. tDQSH, act + tDQSL, act = 1 tCK, act ; with tXYZ, act being the actual measured value of the respective timing parameter in the application.
32. tDSH, act + tDSS, act = 1 tCK, act ; with tXYZ, act being the actual measured value of the respective timing parameter in the application.
