1. SCOPE

1.1 Scope. This drawing documents two product assurance class levels consisting of high reliability (device classes Q and M) and space application (device class V). A choice of case outlines and lead finishes are available and are reflected in the Part or Identifying Number (PIN). When available, a choice of Radiation Hardness Assurance (RHA) levels are reflected in the PIN.

1.2 PIN. The PIN is as shown in the following examples.

For device classes M and Q:

For device class V:

1.2.1 RHA designator. Device classes Q and V RHA marked devices meet the MIL-PRF-38535 specified RHA levels and are marked with the appropriate RHA designator. Device class M RHA marked devices meet the MIL-PRF-38535, appendix A specified RHA levels and are marked with the appropriate RHA designator. A dash (-) indicates a non-RHA device.

1.2.2 Device type(s). The device type(s) identify the circuit function as follows:

<u>Device type</u>	<u>Generic number</u>	<u>Circuit function</u>
01	54AC174	Hex D-type flip-flop with master reset
02	54AC174	Hex D-type flip-flop with master reset

1.2.3 Device class designator. The device class designator is a single letter identifying the product assurance level as listed below. Since the device class designator has been added after the original issuance of this drawing, device classes M and Q designators will not be included in the PIN and will not be marked on the device.

<u>Device class</u>	<u>Device requirements documentation</u>
M	Vendor self-certification to the requirements for MIL-STD-883 compliant, non-JAN class level B microcircuits in accordance with MIL-PRF-38535, appendix A
Q or V	Certification and qualification to MIL-PRF-38535

TABLE I. Electrical performance characteristics - Continued.

- 1/ For tests not listed in the referenced MIL-STD-883, [e.g. V_{IH} , V_{IL} , C_{PD}], utilize the general test procedure under the conditions listed herein.
- 2/ Each input/output, as applicable, shall be tested at the specified temperature for the specified limits, to the tests in table I herein. Output terminals not designated shall be high level logic, low level logic, or open, except as follows:
 - a. V_{IC} (pos) tests, the GND terminal can be open. $T_C = +25^\circ\text{C}$.
 - b. V_{IC} (neg) tests, the V_{CC} terminal shall be open. $T_C = +25^\circ\text{C}$.
 - c. All I_{CC} tests, the output terminal shall be open. When performing these tests, the current meter shall be placed in the circuit such that all current flows through the meter.
- 3/ RHA parts for device type 02 meet all levels M, D, P, L, R, and F of irradiation. However, these parts are only tested at the "F" level. Pre and post irradiation values are identical unless otherwise specified in table I. When performing post irradiation electrical measurements for any RHA level, $T_A = 25^\circ\text{C}$.
- 4/ The word "All" in the device type and device class column means non-RHA limits for all device types and classes.
- 5/ For negative and positive voltage and current values, the sign designates the potential difference in reference to GND and the direction of current flow, respectively; and the absolute value of the magnitude, not the sign, is relative to the minimum and maximum limits, as applicable, listed herein.
- 6/ V_{OH} and V_{OL} tests will be tested at $V_{CC} = 3.0\text{ V}$ and $V_{CC} = 4.5\text{ V}$. V_{OH} and V_{OL} are guaranteed, if not tested, for other values of V_{CC} . Limits shown apply to operation at $V_{CC} = 3.3\text{ V} \pm 0.3\text{ V}$ and $V_{CC} = 5.0\text{ V} \pm 0.5\text{ V}$. Transmission driving tests are performed at $V_{CC} = 5.5\text{ V}$ with a 2 millisecond duration maximum.
- 7/ The V_{IH} and V_{IL} tests are not required if applied as forcing functions for V_{OH} and V_{OL} tests.
- 8/ The maximum limit for this parameter at 100 krad(s) is 2.0 μA .
- 9/ Power dissipation capacitance (C_{PD}) determines both the power consumption (P_D) and dynamic current consumption (I_S). Where:

$$P_D = (C_{PD} + C_L) (V_{CC} \times V_{CC})f + (I_{CC} \times V_{CC})$$

$$I_S = (C_{PD} + C_L) V_{CC}f + I_{CC}$$
 f is the frequency of the input signal and C_L is the external output load capacitance.
- 10/ Tests shall be performed in sequence, attributes data only. Functional tests shall include the truth table and other logic patterns used for fault detection. The test vectors used to verify the truth table shall, at a minimum, test all functions of each input and output. All possible input to output logic patterns per function shall be guaranteed, if not tested, to the truth table in figure 2 herein. Functional tests shall be performed in sequence as approved by the qualifying activity on qualified devices. Allowable tolerances in accordance with MIL-STD-883 for the input voltage levels may be incorporated. For V_{OUT} measurements, $L \leq 0.3V_{CC}$ and $H \geq 0.7V_{CC}$.
- 11/ AC limits at $V_{CC} = 5.5\text{ V}$ are equal to the limits at $V_{CC} = 4.5\text{ V}$ and guaranteed by testing at $V_{CC} = 4.5\text{ V}$. Minimum ac limits for $V_{CC} = 5.5\text{ V}$ are 1.0 ns and guaranteed by guard banding the $V_{CC} = 4.5\text{ V}$ minimum limits to 1.5 ns. For propagation delay tests, all paths must be tested.
