

## Programmable NiCd/NiMH Fast-Charge Management IC

Check for Samples: [bq24401](#)

### FEATURES

- Safe Management of Fast Charge for NiCd and NiMH Battery Packs
- High-Frequency Switching Controller for Efficient and Simple Charger Design
- Pre-Charge Qualification for Detecting Shorted, Damaged, or Overheated Cells
- Fast-Charge Termination by  $\Delta T/\Delta t$ , Maximum Temperature, and Maximum Charge Time
- Selectable Top-Off Mode for Achieving Maximum Capacity in NiMH Batteries
- Programmable Trickle-Charge Mode for Reviving Deeply Discharged Batteries and for Postcharge Maintenance
- Built-in Battery Removal and Insertion Detection
- Sleep Mode for Low Power Consumption

### APPLICATIONS

- Nickel Charger
- High-Power, Multi-Cell Charger

### GENERAL DESCRIPTION

The bq24401 is a programmable, monolithic IC for fast-charge management of nickel cadmium (NiCd) and nickel metal-hydride (NiMH) in single or multi-cell applications.

The bq24401 provides these charge termination criteria:

- Rate of temperature rise ( $\Delta T/\Delta t$ )
- Maximum temperature
- Maximum charge time

For safety, the bq24401 inhibits fast charge until the battery voltage and temperature are within user-defined limits. If the battery voltage is below the low-voltage threshold, the bq24401 uses trickle-charge to condition the battery. For NiMH batteries, the bq24401 provides an optional top-off charge to maximize the battery capacity.

The integrated high-speed comparator allows the bq24401 to be the basis for a complete, high-efficiency battery charger circuit for nickel-based chemistries.

#### 8-Pin DIP or Narrow SOIC or TSSOP

#### Pin Names

SNS	Current-sense input
V <sub>SS</sub>	System ground
LED	Charge-status output
BAT	Battery-voltage input
TS	Temperature-sense input
RC	Timer-program input
V <sub>CC</sub>	Supply-voltage input
MOD	Modulation-control output

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## PIN DESCRIPTIONS

### **SNS**      **Current-sense input**

Enables the bq24401 to sense the battery current via the voltage developed on this pin by an external sense-resistor connected in series with the battery pack

### **V<sub>SS</sub>**      **System Ground**

Connect to the battery's negative terminal

### **LED**      **Charge-status output**

Open-drain output that indicates the charging status by turning on, turning off, or flashing an external LED, driven through a resistor.

### **BAT**      **Battery-voltage input**

Battery-voltage sense input. A simple resistive divider, across the battery terminals, generates this input.

### **TS**      **Temperature-sense input**

Input for an external battery-temperature monitoring circuit. An external resistive divider network with a negative temperature-coefficient thermistor sets the lower and upper temperature thresholds.

### **RC**      **Timer-program input**

Used to program the maximum fast charge-time, maximum top-off charge-time, hold-off period, trickle charge rate, and to disable or enable top-off charge. A capacitor from V<sub>CC</sub> and a resistor to ground connect to this pin.

### **V<sub>CC</sub>**      **Supply-voltage input**

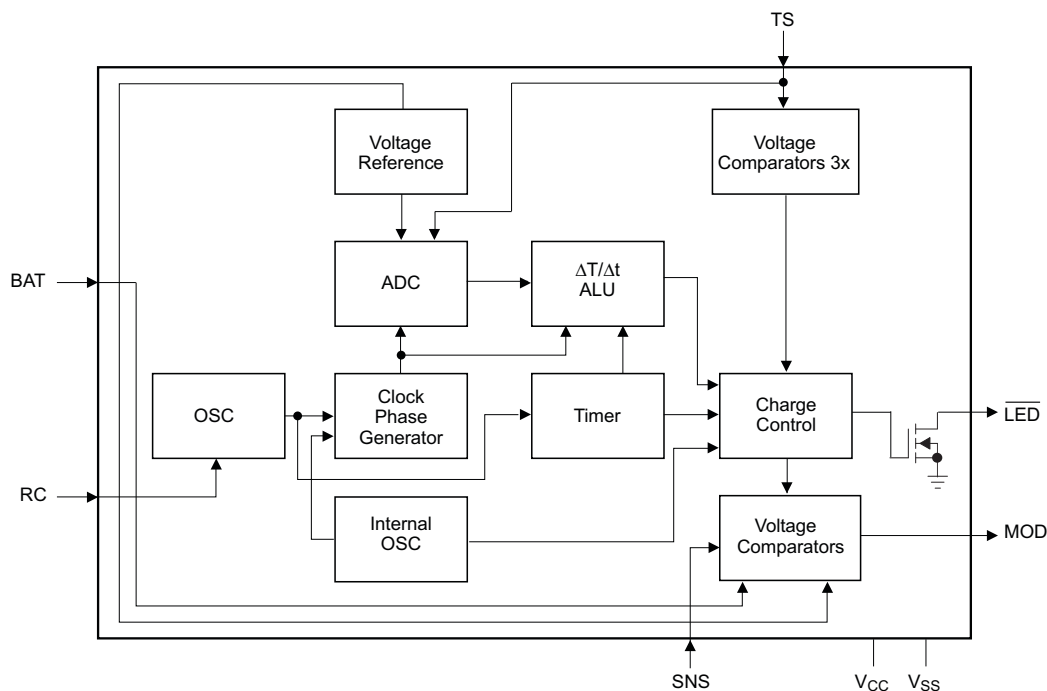

Recommended bypassing is 10μF + 0.1μF to 0.22μF of decoupling capacitance near the pin.

### **MOD**      **Modulation-control output**

Push-pull output that controls the charging current to the battery. MOD switches high to enable charging current to flow and low to inhibit charging-current flow.

## FUNCTIONAL DESCRIPTION

The bq24401 is a versatile, NiCd and NiMH battery charge control device. See [Figure 1](#) for a functional block diagram and [Figure 2](#) for a state diagram.

**Figure 1. Functional Block Diagram**

NOTE: If  $V_{TS} < V_{TCO}$  at any time, may only return to Trickle Maintenance Charge state and not to Top-Off.

**Figure 2. State Diagram**

## ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

		VALUE	UNIT
V <sub>CC</sub>	V <sub>CC</sub> relative to V <sub>SS</sub>	–0.3 to 7	V
V <sub>T</sub>	DC voltage applied on any pin, relative to V <sub>SS</sub>	–0.3 to V <sub>CC</sub>	V
T <sub>OPR</sub>	Operating ambient temperature	–20 to 70	°C
T <sub>STG</sub>	Storage temperature	–40 to 125	°C
T <sub>SOLDER</sub>	Soldering temperature (10 s max.)	260	°C

- (1) Permanent device damage may occur if Absolute Maximum Ratings are exceeded. Functional operation should be limited to the Recommended DC Operating Conditions detailed in this data sheet. Exposure to conditions beyond the operational limits for extended periods of time may affect device reliability.

## DC THRESHOLDS<sup>(1)</sup>

T<sub>A</sub> = T<sub>OPR</sub>; V<sub>CC</sub> = 5V ±20% (unless otherwise specified)

PARAMETER		TEST CONDITIONS	TYPICAL	TOLERANCE	UNIT
V <sub>TCO</sub>	Temperature cutoff	Voltage at the TS pin	0.225 × V <sub>CC</sub>	±5%	V
V <sub>HTF</sub>	High-temperature fault	Voltage at the TS pin	0.25 × V <sub>CC</sub>	±5%	V
V <sub>LTF</sub>	Low-temperature fault	Voltage at the TS pin	0.5 × V <sub>CC</sub>	±5%	V
V <sub>MCV</sub>	Maximum cell voltage	Voltage at the BAT pin	2.00	±2.5%	V
V <sub>LBAT</sub>	Minimum cell voltage	Voltage at the BAT pin	950	±5%	mV
V <sub>Therm</sub>	TS input change for ΔT/Δt detection	Voltage at the TS pin	−V <sub>CC</sub> /161	±25%	V/min
V <sub>SNSHI</sub>	High threshold at SNS	Voltage at the SNS pin	50	±10	mV
V <sub>SNSLO</sub>	Low threshold at SNS	Voltage at the SNS pin	−50	±10	mV
V <sub>SLP</sub>	Sleep-mode input threshold	Voltage at the BAT pin	V <sub>CC</sub> −1	±0.5	V

- (1) All voltages are relative to V<sub>SS</sub> except as noted.

## RECOMMENDED DC OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V <sub>CC</sub>	Supply voltage	4	5	6	V
I <sub>CC</sub>	Supply current	Exclusive of external loads			
I <sub>CCS</sub>	Sleep current	V <sub>BAT</sub> = V <sub>SLP</sub>			5 μA
V <sub>TS</sub>	Thermistor input	V <sub>TS</sub> < 0.5 V prohibited			V
V <sub>OH</sub>	Output high input	MOD, I <sub>OH</sub> = 10 mA			V
V <sub>OL</sub>	Output low input	MOD, $\overline{\text{LED}}$ , I <sub>OL</sub> = 10 mA			0.2 V
I <sub>OZ</sub>	High-impedance leakage current	$\overline{\text{LED}}$			5 μA
I <sub>snk</sub>	Sink current	MOD, $\overline{\text{LED}}$			20 mA
R <sub>MTO</sub>	Charge timer resistor	2			250 kΩ
C <sub>MTO</sub>	Charge timer capacitor	0.001			1 μF

## IMPEDANCE

PARAMETER	MIN	TYP	MAX	UNIT
R <sub>BAT</sub>	Battery input impedance			10 MΩ
R <sub>TS</sub>	TS input impedance			10 MΩ
R <sub>SNS</sub>	SNS input impedance			10 MΩ

## TIMING

T<sub>A</sub> = T<sub>OPR</sub>; V<sub>CC</sub> = 5 V ±20% (unless otherwise noted)

PARAMETER	MIN	TYP	MAX	UNIT
d <sub>MTO</sub>	MTO time-base variation			–5% 5%
f <sub>TRKL</sub>	Pulse-trickle frequency			0.9 1 1.1 Hz

## Initiation and Charge Qualification

The bq24401 initiates a charge cycle when it detects

- Application of power to  $V_{CC}$
- Battery replacement
- Exit from sleep mode

Immediately following initiation, the IC enters a charge-qualification mode. The bq24401 charge qualification is based on battery voltage and temperature. If the voltage on the BAT pin is less than the internal threshold,  $V_{LBAT}$ , the bq24401 enters the battery conditioning state. This condition indicates the possibility of a defective or shorted battery pack. In an attempt to revive a fully depleted pack, the bq24401 enables the MOD pin to trickle-charge at a rate of once every 1.0s. As explained in the section "Top-Off and Pulse-Trickle Maintenance Charge," the trickle pulse-width is user-selectable and is set by the value of the resistance connected between the RC pin and  $V_{SS}$ .

During charge qualification, the  $\overline{LED}$  pin blinks at a 1Hz rate, indicating the pending status of the charger.

Once battery conditioning (trickle charge) has raised the voltage on the BAT pin above  $V_{LBAT}$ , the IC enters fast charge, if the battery temperature is within the  $V_{LTF}$  to  $V_{HTF}$  range. The bq24401 will stay in the battery conditioning state indefinitely and will not progress to fast charge until the voltage on the BAT pin is above  $V_{LBAT}$  and the temperature is within the  $V_{LTF}$  and  $V_{HTF}$  range. No timer is implemented during battery conditioning.

## Fast Charge (Current Regulation)

Following charge qualification (which includes trickle charge, if required), the bq24401 begins fast charge fast using a current-limited algorithm. During the fast-charge period, it monitors charge time, temperature, and voltage for adherence to the termination criteria. This monitoring is further explained in later sections. While in the fast charge state, the  $\overline{LED}$  pin is pulled low (the LED is on). Following fast charge, the battery is topped off, if top-off is selected. The charging cycle ends with a trickle maintenance-charge that continues as long as the voltage on the BAT pin remains below  $V_{MCV}$ .

Table 1 summarizes the charging process.

**Table 1. Charge Algorithm**

BATTERY CHEMISTRY	CHARGE ALGORITHM
NiCd or NiMH Batteries ( $V_{BAT} < V_{MCV}$ always)	<ol style="list-style-type: none"> <li>1. Charge qualification</li> <li>2. Trickle charge, if required</li> <li>3. Fast charge (constant current)</li> <li>4. Fast charge termination (rate of temperature rise, maximum charge time = 1 MTO)</li> <li>5. Top-off (optional)</li> <li>6. Trickle charge</li> </ol>

## FAST CHARGE TERMINATION

### Initial Hold-Off Period

The bq24401 incorporates a user programmable hold-off period to avoid premature fast charge termination that can occur with brand new nickel cells at the very beginning of fast charge. The values of the external resistor and capacitor connected to the RC pin set the initial hold-off period. During this period, the bq24401 avoids early termination due to an initial rise in the battery temperature by disabling the rate of temperature rise ( $\Delta T/\Delta t$ ) feature. This period is fixed at the programmed value of the maximum charge time (MTO) divided by 32.

$$\text{hold-off period} = \frac{\text{MTO}}{32} \quad (1)$$

## Maximum Charge Time

The bq24401 sets the maximum charge-time through the RC pin. With the proper selection of external resistor and capacitor values, various time-out values may be achieved. If the timer expires while still in fast charge, the bq24401 proceeds to top-off charge (if top-off is enabled) or trickle maintenance charge. If top-off is enabled, the timer is reset on the completion of fast charge before beginning top-off charge. Figure 3 shows a typical connection.

Figure 3. Typical Connection for the RC Input

The following equation shows the relationship between the  $R_{MTO}$  and  $C_{MTO}$  values and the maximum charge time (MTO) for the bq24401:

$$MTO = R_{MTO} \times C_{MTO} \times 35,988 \quad (2)$$

MTO is measured in minutes,  $R_{MTO}$  in ohms, and  $C_{MTO}$  in farads. (**Note:**  $R_{MTO}$  and  $C_{MTO}$  values also determine other features of the device. See Table 4 for details.)

If, during fast charge,  $V_{TS} > V_{LTF}$ , then the timer is paused and the IC enters battery conditioning charge until  $V_{TS} < V_{LTF}$ . Since the IC is in the battery conditioning state, the LED flashes at the 1 Hz rate. Once  $V_{TS} < V_{LTF}$ , fast charge restarts and the timer resumes from where it left off with no change in total fast charge time.

## Maximum Temperature

A negative-coefficient thermistor, referenced to  $V_{SS}$  and placed in thermal contact with the battery, may be used as a temperature-sensing device. Figure 4 shows a typical temperature-sensing circuit.

Figure 4. Temperature Monitoring Configuration

During fast charge, the bq24401 compares the battery temperature to an internal high-temperature cutoff threshold,  $V_{TCO}$ , and a low-temperature threshold,  $V_{LTF}$ . During fast charge only, the  $V_{HTF}$  fault comparator is

disabled. When the voltage at the TS pin is lower than  $V_{TCO}$ , the bq24401 terminates fast charge, moves to the charge suspended state, and turns off the  $\overline{LED}$ . When  $V_{TS}$  rises above  $V_{HTF}$ , the bq24401 will resume charging in the trickle maintenance charge state, per Figure 2. In fast charge, when the voltage on the TS pin is higher than  $V_{LTF}$ , the charger enters the battery conditioning state, as described in the previous section. Fast charge is resumed when  $V_{TS}$  is less than  $V_{LTF}$ .

### Rate of Temperature Rise

The bq24401 uses a rate of temperature rise ( $\Delta T/\Delta t$ ) scheme to terminate fast charge for NiCd and NiMH batteries. During fast charge, it samples the TS pin voltage every 8 seconds and compares it to the value measured 2 samples earlier. This feature terminates fast charge if this voltage declines at a rate of  $V_{CC}/161$  (V/min). Figure 4 shows a typical connection diagram. In preparation for sampling the TS pin voltage, the bq24401 briefly turns off most circuits (the MOD and RC pins will both go low) in order to get the cleanest possible, noise-free measurement. While the monitoring of the TS pin voltage is continuous, the sampling of the TS pin voltage with the internal ADC only occurs during fast charge.

### Top-Off and Pulse-Trickle Maintenance Charge

Once constant-current fast charge has ended, the bq24401 measures the value of the  $C_{MTO}$  capacitor and then proceeds to either top-off or trickle maintenance charge. Top-off is optional and may be desirable on batteries that have a tendency to terminate charge before reaching full capacity. To enable this option, the capacitance value of  $C_{MTO}$  connected between the RC pin and  $V_{CC}$  (see Figure 3) should be greater than  $0.13\mu F$ , and the value of the resistor connected to this pin should be less than  $250k\Omega$ . To disable top-off, the capacitance value should be less than  $0.07\mu F$ . The tolerance of the capacitor needs to be taken into account in component selection.

Once top-off is started, the timer is reset and top-off proceeds until the timer expires,  $V_{MCV}$  is reached, or there is a temperature fault. During top-off, current is delivered to the battery in pulses that occur each second. The fixed pulse width allows an average current of 1/16 of the fast charge current to be delivered to the battery every second. The  $\overline{LED}$  is always off during top-off and trickle maintenance charge.

During top-off, there are three different temperature faults that can occur. If  $V_{TS} > V_{LTF}$ , top-off is suspended, the timer is paused, and trickle charge is started. When  $V_{TS}$  falls below  $V_{LTF}$ , top-off is resumed. If  $V_{TS} < V_{HTF}$ , all charging stops, but the timer keeps counting. When  $V_{TS} > V_{HTF}$ , top-off is resumed, if there is still time remaining on the timer. If there is not time left, trickle maintenance charge is entered. If  $V_{TS} < V_{TCO}$ , all charging stops. Only trickle maintenance charge may resume after  $V_{TS} > V_{HTF}$ .

Following top-off, the bq24401 trickle-charges the battery by enabling the MOD pin to charge at a rate of once every 1.0 second. The trickle pulse-width is user-selectable and is set by the value of the resistor  $R_{MTO}$ , connected between the RC pin and  $V_{SS}$ . Figure 5 shows the relationship between the trickle pulse-width and the value of  $R_{MTO}$ . The typical tolerance of the pulsewidth below  $150k\Omega$  is  $\pm 10\%$ .

Figure 5. Relationship Between Trickle Pulse-Width and Value of  $R_{MTO}$

Note that with an  $R_{MTO}$  value around 150 k $\Omega$ , the trickle charge pulse width is nearly identical to the top-off pulse width of 62.5 ms (1/16 of a second for a 1A fast charge current). With  $R_{MTO}$  values near 150 k $\Omega$ , it can be difficult to tell which state the IC is in (top-off or trickle charge). The best way to tell if the bq24401 is in top-off or trickle charge is to look at the RC pin when the temperature is between the LTF and HTF. In top-off, the RC pin is counting and has a sawtooth waveform on it. In trickle charge, there is no timer and the RC pin is at a DC value.

The RC pin contains valuable information in determining what state the bq24401 is in, since it always operates in one of three modes. If the RC pin is low (around  $V_{SS}$  potential), the IC is in sleep mode. (If the RC pin is low for brief instants during fast charge, the bq24401 is sampling the TS pin for  $\Delta T/\Delta t$ ). If the RC pin is at some DC value (usually around 1-2V), then the IC has paused the timer or the timer is inactive. If the RC pin is a sawtooth waveform (similar to [Figure 14](#)), then the timer is running and the RC pin is considered “active.” Lastly, the RC pin can be loaded by too large of a C or too small of an R. This will sometimes make the usual sawtooth waveform look like a triangle waveform on an oscilloscope (the rise time is lengthened), or the RC signal could have the appearance of being clipped (flat top or bottom). The timer is unreliable under these conditions and the bq24401 should not be operated in this manner. [Table 2](#) summarizes the different states of the RC pin.

**Table 2. RC Pin Status**

<b>bq24401 CHARGE STATE</b>	<b>TS PIN STATE</b>	<b>RC PIN BEHAVIOR</b>
Battery absent	N/A	1-2V DC level
Sleep mode	N/A	Ground ( $V_{SS}$ )
Charge qualification (including battery conditioning (trickle charge) and charge suspended)	N/A	1-2V DC level
Fast charge (current regulation)	$V_{TS} < V_{LTF}$	Active
	$V_{TS} > V_{LTF}$ (in battery conditioning state)	1-2V DC level (timer is paused and will resume when $V_{TS} < V_{LTF}$ )
Top-off charge	$V_{TS} > V_{LTF}$ (in trickle maintenance charge state)	1-2V DC level (timer is paused and will resume when $V_{TS} < V_{LTF}$ )
	$V_{LTF} > V_{TS} > V_{HTF}$	Active
	$V_{HTF} > V_{TS} > V_{TCO}$	Active (timer is still counting, even though charging is suspended)
Trickle maintenance charge (after fast charge)	N/A	1-2V DC level
Charge complete	N/A	Active

Both top-off and trickle maintenance charge are terminated and the pack never receives any more charge (until a charge initialization occurs) if the voltage on the BAT pin reaches  $V_{MCV}$ . During trickle maintenance charge, charging is suspended if  $V_{TS} < V_{HTF}$ . It resumes when  $V_{TS} > V_{HTF}$ . The bq24401 is designed to remain in trickle maintenance charge forever (excluding the two faults just mentioned) in order to keep the Nickel pack full.

## Charge Current Control

The bq24401 implements a hysteretic control loop that regulates the current being delivered to the battery pack to a user programmable value that is set by the value of the  $R_{SNS}$  resistor. A second, outer control loop reduces the average current delivered to the pack in order to clamp the voltage at the BAT pin to a maximum of  $V_{MCV}$ . The bq24401 controls the MOD pin to regulate the current and voltage of the pack. The bq24401 monitors charge current at the SNS input by sensing the voltage drop across a sense-resistor,  $R_{SNS}$ , in series with the battery pack. See [Figure 6](#) for a typical current-sensing circuit.

Figure 6. Current-Sensing Circuit

$R_{SNS}$  is sized to provide the desired fast-charge current ( $I_{MAX}$ ).

$$I_{MAX} = \frac{0.05}{R_{SNS}} \quad (3)$$

If the voltage at the SNS pin is greater than  $V_{SNSLO}$  or less than  $V_{SNSHI}$ , the bq24401 switches the MOD output high to pass charge current to the battery. When the SNS voltage is less than  $V_{SNSLO}$  or greater than  $V_{SNSHI}$ , the bq24401 switches the MOD output low to shut off charging current to the battery. A hysteresis capacitor ( $C_{HYS}$ ) is required between the  $C_{MOD}$  pin and the SNS pin to add a healthy amount of hysteresis to the current sense signal (see Figure 7). Typical hysteresis values are between 5 and 25 mV. The amount of hysteresis can be calculated by examining the capacitive divider formed by  $C_{HYS}$  and  $C_f$ .

$$\text{Hysteresis (V)} = V_{CC} \times \frac{C_{HYS}}{(C_{HYS} + C_f)} \quad (4)$$

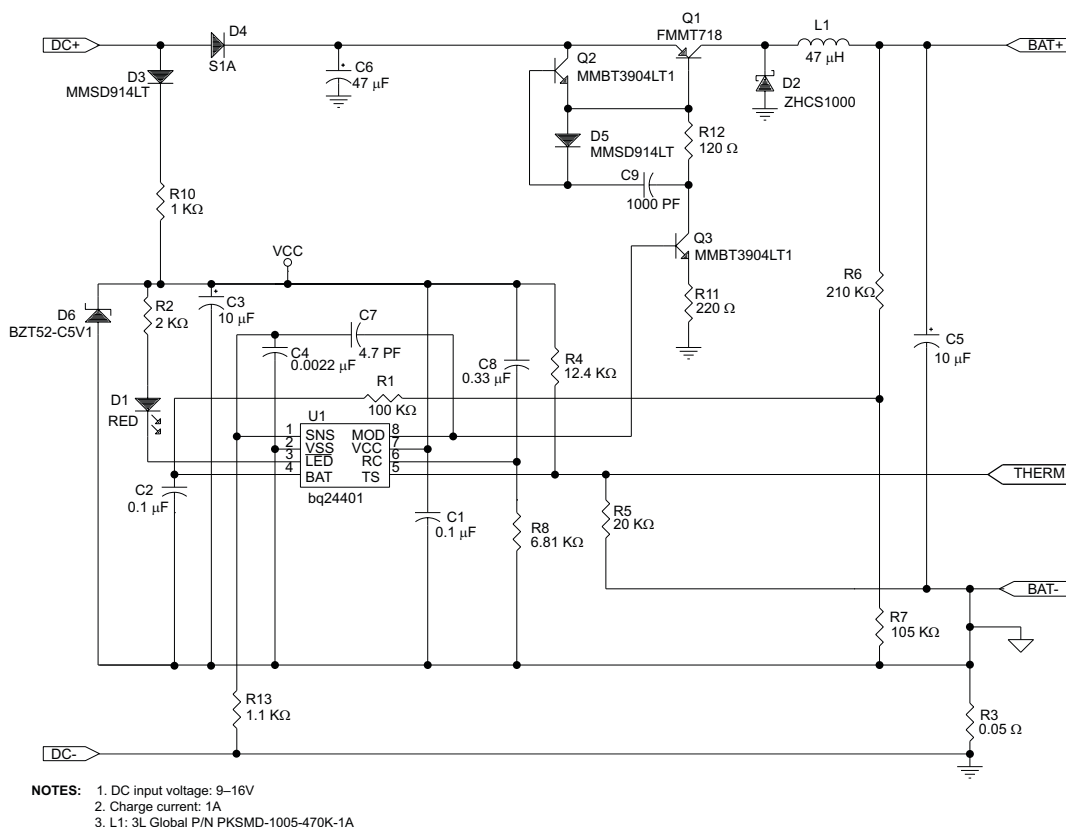

Figure 7. 3-Cell NiCd/NiMH 1A Charger

Being a hysteretic controller, the switching frequency of the bq24401 is determined by the values of several of the external circuit components. The components that affect the switching frequency are: input voltage,  $R_{SNS}$  value, inductor value, hysteresis capacitor value ( $C_{HYS}$ ), and the value of the filter on the current sense signal ( $R_f$  and  $C_f$  values).  $R_f$  and  $C_f$  have the most impact on the switching frequency and are also the components that are easiest to change to adjust the frequency, as they do not affect anything else in the circuit (besides, of course, the cleanliness and quality of the current sense signal being fed to the bq24401). In general, increasing the input voltage and/or inductor value or decreasing  $C_{HYS}$  and/or the  $R_f \times C_f$  filter corner frequency will increase the switching frequency. Figure 8 and Figure 9 show empirical data on the variation in switching frequency based on adjusting  $R_f$  and  $C_f$ . This data was taken with an input voltage of 12V, inductor value of 220  $\mu$ H,  $R_{SNS}$  value of 50 m $\Omega$ , and  $C_{HYS}$  value of 4.7 pF. Typical switching frequencies for the bq24401 are between 100 and 200 kHz, though it is possible to achieve switching frequencies in excess of 300kHz.

**Figure 8. Switching Frequency vs Capacitance**

**Figure 9. Switching Frequency vs Resistance**

**Battery Voltage Input**

As shown in [Figure 10](#), a resistor voltage-divider between the battery pack's positive terminal and  $V_{SS}$  scales the battery voltage measured at the BAT pin. A low-pass filter then smooths out this voltage to present a clean signal to the BAT pin.

**Figure 10. Battery Voltage Divider and Filter**

The resistor values  $R_{B1}$  and  $R_{B2}$  are calculated by the following equation:

$$\frac{R_{B1}}{R_{B2}} = N - 1 \tag{5}$$

where  $N$  is the number of cells in series.  $R_{B1} + R_{B2}$  should be at least 200k $\Omega$  and no more than 1M $\Omega$ .

**TEMPERATURE MONITORING**

The bq24401 measures the temperature by the voltage at the TS pin. This voltage is typically generated by a negative-temperature-coefficient thermistor. The bq24401 compares this voltage against its internal threshold voltages to determine if charging is safe. These thresholds are the following:

- High-temperature cutoff voltage:  $V_{TCO} = 0.225 \times V_{CC}$ . This voltage corresponds to the maximum temperature (TCO) at which any charging is allowed. The bq24401 terminates charging if the voltage on the TS pin falls below  $V_{TCO}$ .
- High-temperature fault voltage:  $V_{HTF} = 0.25 \times V_{CC}$ . This voltage corresponds to a maximum allowed pack temperature (HTF) in all states except for fast charge. During fast charge, HTF faults are disabled to allow for a normal increase in pack temperature.
- Low-temperature fault voltage:  $V_{LTF} = 0.5 \times V_{CC}$ . This voltage corresponds to the minimum temperature (LTF) at which fast charging or top-off is allowed. If the voltage on the TS pin rises above  $V_{LTF}$ , the bq24401 suspends either fast charge or top-off and begins a trickle charge. When the voltage falls back below  $V_{LTF}$ , fast charge or top-off resumes from the point where suspended. If  $V_{TS} > V_{LTF}$ , the charger will always be in trickle charge.

[Table 3](#) summarizes these various conditions.

**Table 3. Temperature-Monitoring Conditions and Actions**

TEMPERATURE	CONDITION	ACTION
$V_{TS} > V_{LTF}$	Cold battery – checked at all times	During charge qualification, no effect
		During fast charge, suspends fast charge and moves into charge qualification, pauses timer, and flashes LED
		During top-off, suspends top-off and moves into trickle maintenance charge and pauses timer
		During trickle maintenance charge, no effect
$V_{HTF} < V_{TS} < V_{LTF}$	Optimal charging range	Allows all stages of charging

**Table 3. Temperature-Monitoring Conditions and Actions (continued)**

TEMPERATURE	CONDITION	ACTION
$V_{TS} < V_{HTF}$	Hot battery – checked at all times, except during fast charge	During charge qualification, stops charging
		During fast charge, no effect
		During top-off, stops charging
		During trickle maintenance charge, stops charging
$V_{TS} < V_{TCO}$	Battery exceeding maximum allowable temperature – checked at all times	During charge qualification, stops charging
		During fast charge, terminates fast charge and stops charging, turns off LED
		During top-off, terminates top-off and stops charging
		During trickle maintenance charge, stops charging

**Table 4. Summary of NiCd or NiMH Charging Characteristics**

PARAMETER	VALUE <sup>(1)</sup>
Maximum cell voltage ( $V_{MCV}$ )	2 V
Minimum pre-charge qualification voltage ( $V_{LBAT}$ )	950 mV
High-temperature cutoff voltage ( $V_{TCO}$ )	$0.225 \times V_{CC}$
High-temperature fault voltage ( $V_{HTF}$ )	$0.25 \times V_{CC}$
Low-temperature fault voltage ( $V_{LTF}$ )	$0.5 \times V_{CC}$
bq24401 fast-charge maximum time out (MTO)	$R_{MTO} \times C_{MTO} \times 35,988$
Fast-charge charging current ( $I_{MAX}$ )	$0.05/R_{SNS}$
Hold-off period	MTO/32
Top-off charging current (optional)	$I_{MAX}/16$
Top-off period (optional)	MTO
Trickle-charge frequency	1Hz
Trickle-charge pulse-width	See <a href="#">Figure 5</a>

(1) See the DC Thresholds Specification for details.

## Charge Status Display

The charge status is indicated by open-drain output  $\overline{LED}$ . [Table 5](#) summarizes the display output of the bq24401. A temperature fault or timer expiring changes the charge state immediately (according to [Figure 2](#)) and will thus change the  $\overline{LED}$  status immediately and accordingly.

**Table 5. Charge Status Display**

bq24401 CHARGE STATE	$\overline{LED}$ STATUS
Charge qualification (including battery conditioning and charge suspended)	1 Hz flash
Fast charge (current regulation)	Low
Top-off charge	High impedance
Trickle maintenance charge (after fast charge)	
Charge complete	
Battery absent	
Sleep mode	

## Sleep Mode

The bq24401 features a sleep mode for low power consumption. This mode is enabled when the voltage at the BAT pin is above the low-power-mode threshold,  $V_{SLP}$ . During sleep mode, the bq24401 shuts down all unnecessary internal circuits, drives the  $\overline{LED}$  output to high-impedance state, and drives the MOD pin low. Restoring BAT below the  $V_{MCV}$  threshold initiates the IC and starts a fast-charge cycle. Normally, the bq24401 only enters sleep mode when there is no battery connected on the output and the charger is idling with nothing to

charge. In addition,  $V_{IN}$  needs to be high enough such that when  $V_{IN}$  is present on the output,  $V_{BAT}$  would be greater than  $V_{SLP}$ . In sleep mode, the output voltage will decay to  $V_{MCV}$  at which point the bq24401 turns on and pulses the MOD pin several times. With no battery connected, the output will rise to near  $V_{IN}$  at which point the bq24401 re-enters sleep mode. During sleep mode, the RC pin will be at  $V_{SS}$  potential. A typical sleep mode waveform is shown in [Figure 17](#).

## REVISION HISTORY

### Changes from Revision September 2001 (\*) to Revision A

**Page**

- Changed the data sheet format. The data sheet was originally from Benchmark Products. In revision A, the data sheet was converted to the TI format, and a re-write of the data sheet was implemented ..... [1](#)

**PACKAGING INFORMATION**

Orderable Device	Status <sup>(1)</sup>	Package Type	Package Drawing	Pins	Package Qty	Eco Plan <sup>(2)</sup>	Lead/Ball Finish	MSL Peak Temp <sup>(3)</sup>
BQ24401D	ACTIVE	SOIC	D	8	75	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM
BQ24401DG4	ACTIVE	SOIC	D	8	75	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM
BQ24401DR	ACTIVE	SOIC	D	8	2500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM
BQ24401DRG4	ACTIVE	SOIC	D	8	2500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM
BQ24401PW	ACTIVE	TSSOP	PW	8	150	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR
BQ24401PWG4	ACTIVE	TSSOP	PW	8	150	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR
BQ24401PWR	ACTIVE	TSSOP	PW	8	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR
BQ24401PWRG4	ACTIVE	TSSOP	PW	8	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

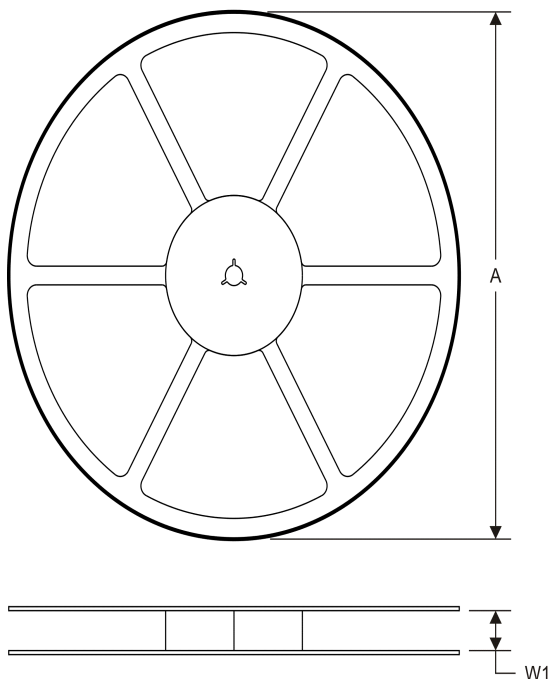

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**TAPE AND REEL INFORMATION**
**REEL DIMENSIONS**

**TAPE DIMENSIONS**

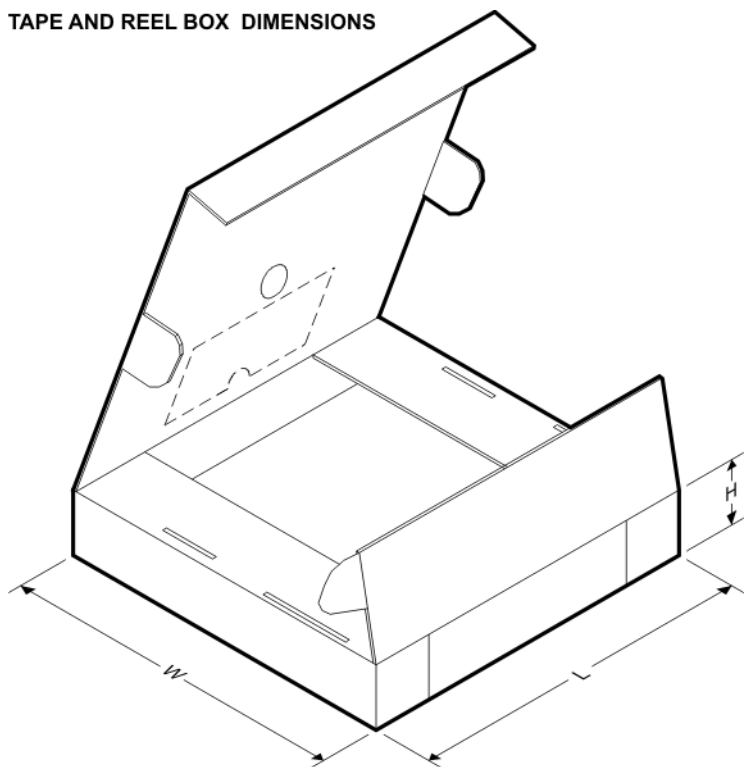

A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

**TAPE AND REEL INFORMATION**

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
BQ24401DR	SOIC	D	8	2500	330.0	12.4	6.4	5.2	2.1	8.0	12.0	Q1
BQ24401PWR	TSSOP	PW	8	2000	330.0	12.4	7.0	3.6	1.6	8.0	12.0	Q1

## TAPE AND REEL BOX DIMENSIONS

PLASTIC SMALL OUTLINE

4040064-7/G 02/11

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.
  - D. Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
  - E. Falls within JEDEC MO-153

D (R-PDSO-G8)

PLASTIC SMALL OUTLINE

## NOTES:

- A. All linear dimensions are in inches (millimeters).
- B. This drawing is subject to change without notice.
- $\triangle C$  Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.006 (0,15) each side.
- $\triangle D$  Body width does not include interlead flash. Interlead flash shall not exceed 0.017 (0,43) each side.
- E. Reference JEDEC MS-012 variation AA.

D (R-PDSO-G8)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate designs.
  - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
  - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46C and to discontinue any product or service per JESD48B. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components which meet ISO/TS16949 requirements, mainly for automotive use. Components which have not been so designated are neither designed nor intended for automotive use; and TI will not be responsible for any failure of such components to meet such requirements.
