

Stereo Audio Volume Control

FEATURES

- **DIGITALLY-CONTROLLED ANALOG VOLUME CONTROL**
Two Independent Audio Channels
Serial Control Interface
Zero Crossing Detection
Mute Function
- **WIDE GAIN AND ATTENUATION RANGE**
+31.5dB to -95.5dB with 0.5dB Steps
- **LOW NOISE AND DISTORTION**
120dB Dynamic Range
0.0004% THD+N at 1kHz (U-Grade)
0.0002% THD+N at 1kHz (A-Grade)
- **NOISE-FREE LEVEL TRANSITIONS**
- **LOW INTERCHANNEL CROSSTALK**
-130dBFS
- **POWER SUPPLIES: $\pm 5V$ Analog, +5V Digital**
- **AVAILABLE IN DIP-16 AND SOL-16 PACKAGES**
- **PIN AND SOFTWARE COMPATIBLE WITH THE CRYSTAL CS3310**

APPLICATIONS

- **AUDIO AMPLIFIERS**
- **MIXING CONSOLES**
- **MULTI-TRACK RECORDERS**
- **BROADCAST STUDIO EQUIPMENT**
- **MUSICAL INSTRUMENTS**
- **EFFECTS PROCESSORS**
- **A/V RECEIVERS**
- **CAR AUDIO SYSTEMS**

DESCRIPTION

The PGA2311 is a high-performance, stereo audio volume control designed for professional and high-end consumer audio systems. Using high performance operational amplifier stages internal to the PGA2311 yields low noise and distortion, while providing the capability to drive 600 Ω loads directly without buffering. The 3-wire serial control interface allows for connection to a wide variety of host controllers, in addition to support for daisy-chaining of multiple PGA2311 devices.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

| | |
|--------------------------------------|---------------------------|
| Supply Voltage, V_{A+} | +5.5V |
| V_{A-} | -5.5V |
| V_{D+} | +5.5V |
| V_{A+} to V_{D+} | $< \pm 0.3V$ |
| Analog Input Voltage | 0V to V_{A+} , V_{A-} |
| Digital Input Voltage | -0.3V to V_{D+} |
| Operating Temperature Range | -40°C to +85°C |
| Storage Temperature Range | -65°C to +150°C |
| Junction Temperature | +150°C |
| Lead Temperature (soldering, 10s) | +300°C |
| Package Temperature (IR reflow, 10s) | +235°C |

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability.

**ELECTROSTATIC
DISCHARGE SENSITIVITY**

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(NOTE: All plots taken with PGA2311 A-Grade.)

GENERAL DESCRIPTION

The PGA2311 is a stereo audio volume control. It may be used in a wide array of professional and consumer audio equipment. The PGA2311 is fabricated in a sub-micron CMOS process.

The heart of the PGA2311 is a resistor network, an analog switch array, and a high-performance op amp stage. The switches are used to select taps in the resistor network that, in turn, determine the gain of the amplifier stage. Switch selections are programmed using a serial control port. The serial port allows connection to a wide variety of host controllers. Figure 1 shows a functional block diagram of the PGA2311.

POWER-UP STATE

On power up, "power-up reset" is activated for about 100ms during which the circuit is in hardware MUTE state and all internal flip-flops are reset. At the end of this period, the offset calibration is initiated without any external signals. Once this has been completed, the gain byte value for both the left and right channels are set to 00_{HEX}, or the software MUTE condition. The gain will remain at this setting until the host controller programs new settings for for each channel via the serial control port.

If during normal operation the power supply voltage drops below $\pm 3.2\text{V}$, the circuit enters a hardware MUTE state. A power-up sequence will be initiated if the power supply voltage returns to greater than $\pm 3.2\text{V}$.

ANALOG INPUTS AND OUTPUTS

The PGA2311 includes two independent channels, referred to as the left and right channels. Each channel has a corresponding input and output pin. The input and output pins are unbalanced, or referenced to analog ground (either AGNDR or AGNDL). The inputs are named V_{INR} (pin 9) and V_{INL} (pin 16), while the outputs are named V_{OUTR} (pin 11) and V_{OUTL} (pin 14).

The input and output pins may swing within 1.25V of the analog power supplies, V_{A+} (pin 12) and V_{A-} (pin 13). Given $V_{A+} = +5\text{V}$ and $V_{A-} = -5\text{V}$, the maximum input or output voltage range is 7.5Vp-p.

For optimal performance, it is best to drive the PGA2311 with a low source impedance. A source impedance of 600 Ω or less is recommended. Source impedances up to 2k Ω will cause minimal degradation of THD+N. Please refer to the "THD+N vs Source Impedance" plot in the Typical Characteristics section of the datasheet.

Figure 1. PGA2311 Block Diagram.

SERIAL CONTROL PORT

The serial control port is utilized to program the gain settings for the PGA2311. The serial control port includes three input pins and one output pin. The inputs include \overline{CS} (pin 2), SDI (pin 3), and SCLK (pin 6). The sole output pin is SDO (pin 7).

The \overline{CS} pin functions as the chip select input. Data may be written to the PGA2311 only when \overline{CS} is LOW. SDI is the serial data input pin. Control data is provided as a 16-bit word at the SDI pin, 8 bits each for the left and right channel gain settings.

Data is formatted as MSB first, straight binary code. SCLK is the serial clock input. Data is clocked into SDI on the rising edge of SCLK.

SDO is the serial data output pin, and is used when daisy-chaining multiple PGA2311 devices. Daisy-chain operation is described in detail later in this section. SDO is a tri-state output, and assumes a high impedance state when \overline{CS} is HIGH.

The protocol for the serial control port is shown in Figure 2. See Figure 3 for detailed timing specifications for the serial control port.

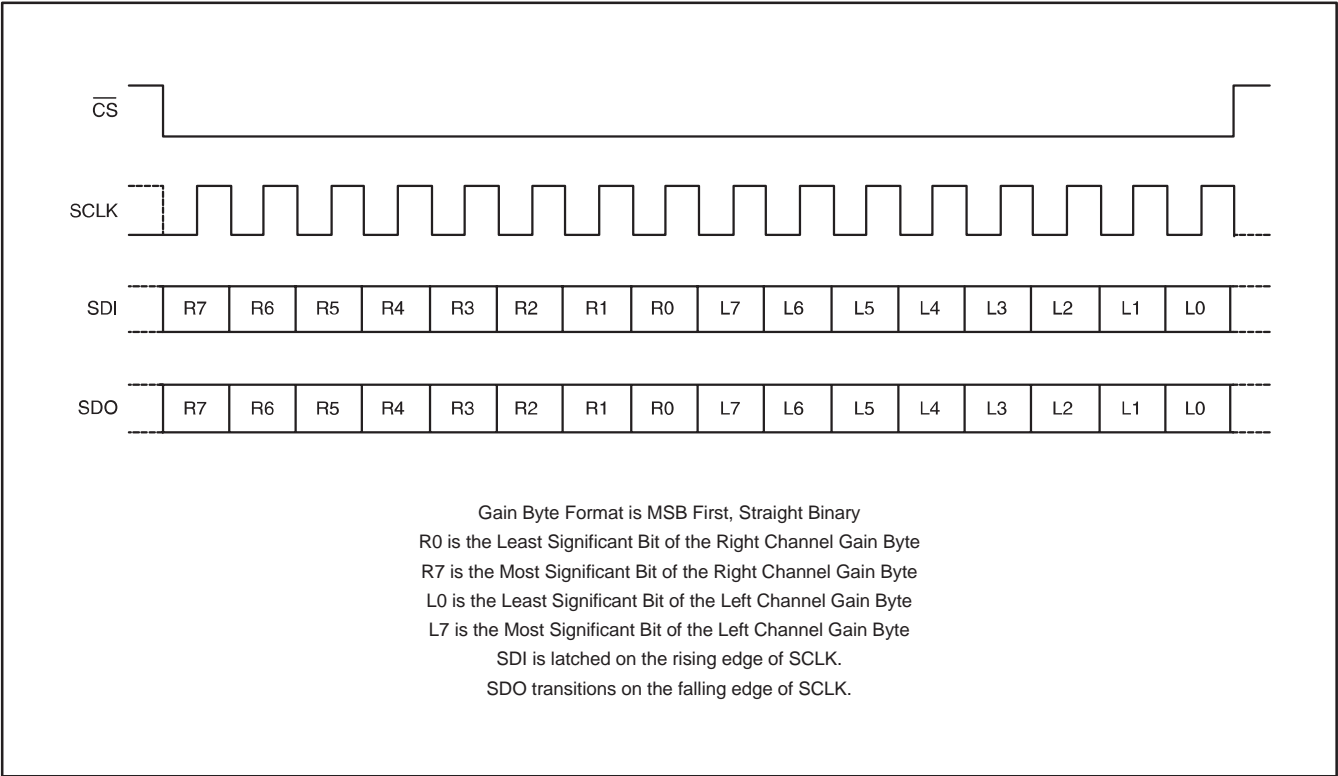

Figure 2. Serial Interface Protocol.

GAIN SETTINGS

The gain for each channel is set by its corresponding 8-bit code, either R[7:0] or L[7:0] (see Figure 2). The gain code data is straight binary format. If we let N equal the decimal equivalent of R[7:0] or L[7:0], then the following relationships exist for the gain settings:

For N = 0:

Mute Condition. The input multiplexer is connected to analog ground (AGNDR or AGNDL).

For N = 1 to 255:

$$\text{Gain (dB)} = 31.5 - [0.5 \times (255 - N)]$$

This results in a gain range of +31.5dB (with N = 255) to -95.5dB (with N = 1).

Changes in gain setting may be made with or without zero crossing detection. The operation of the zero crossing detector and timeout circuitry is discussed later in this data sheet.

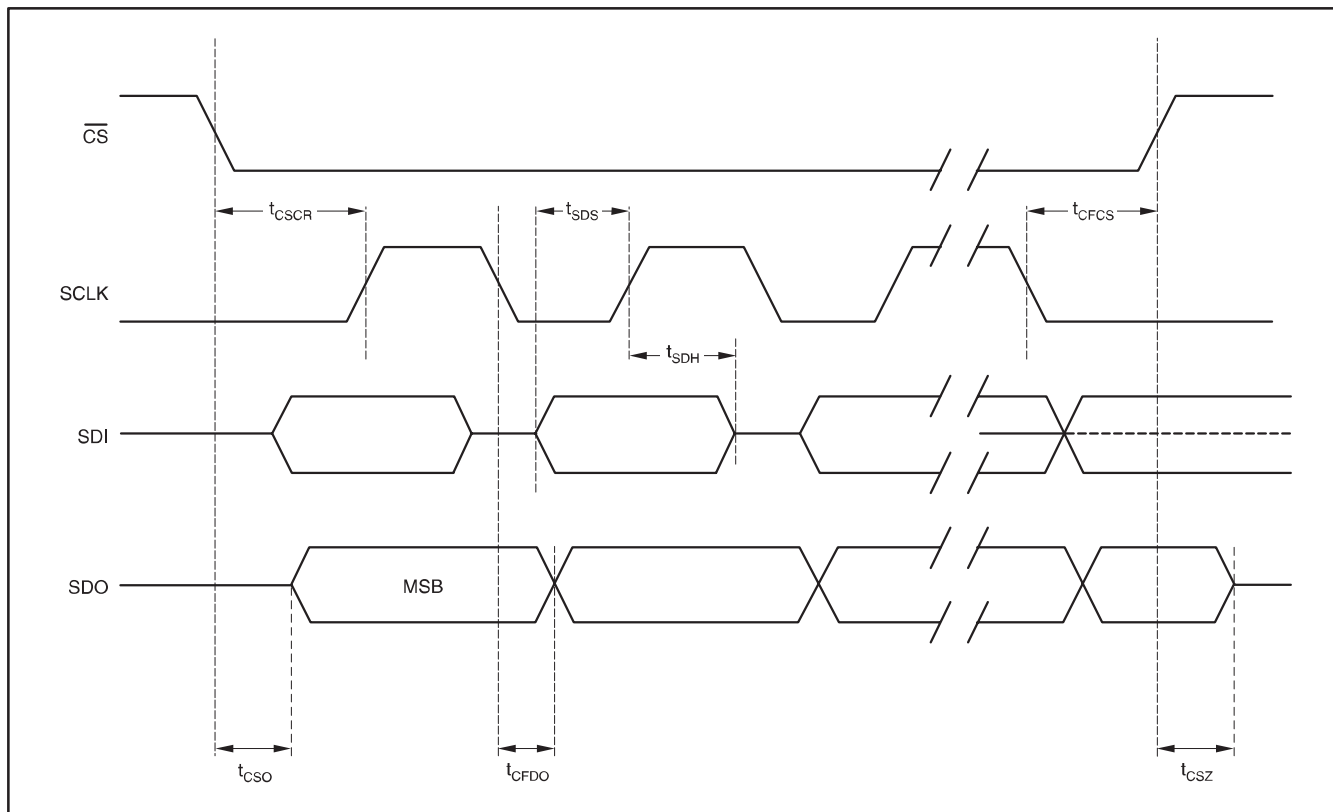

Figure 3. Serial Interface Timing Requirements.

DAISY-CHAINING MULTIPLE PGA2311 DEVICES

In order to reduce the number of control signals required to support multiple PGA2311 devices on a printed circuit board, the serial control port supports daisy-chaining of multiple PGA2311 devices. Figure 4 shows the connection requirements for daisy-chain operation. This arrangement allows a 3-wire serial interface to control many PGA2311 devices.

As shown in Figure 4, the SDO pin from device #1 is connected to the SDI input of device #2, and is repeated for additional devices. This in turn forms a large shift register, in which gain data may be written for all PGA2311s connected to the serial bus. The length of the shift register is $16 \cdot N$ bits, where N is equal to the number of PGA2311 devices included in the chain. The \overline{CS} input must remain LOW for $16 \cdot N$ SCLK periods, where N is the number of devices connected in the chain, in order to allow enough SCLK cycles to load all devices.

ZERO CROSSING DETECTION

The PGA2311 includes a zero crossing detection function that can provide for noise-free level transitions. The concept is to change gain settings on a zero crossing of the input signal, thus minimizing audible glitches. This function is enabled or disabled using the ZCEN input (pin 1). When ZCEN is LOW, zero crossing detection is disabled. When ZCEN is HIGH, zero crossing detection will be enabled.

The zero crossing detection takes effect with a change in gain setting for a corresponding channel. The new gain setting will not be implemented until either positive slope zero crossing is detected or a time-out period of 16ms has elapsed. In the case of a time-out, the new gain setting takes effect with no attempt to minimize audible artifacts.

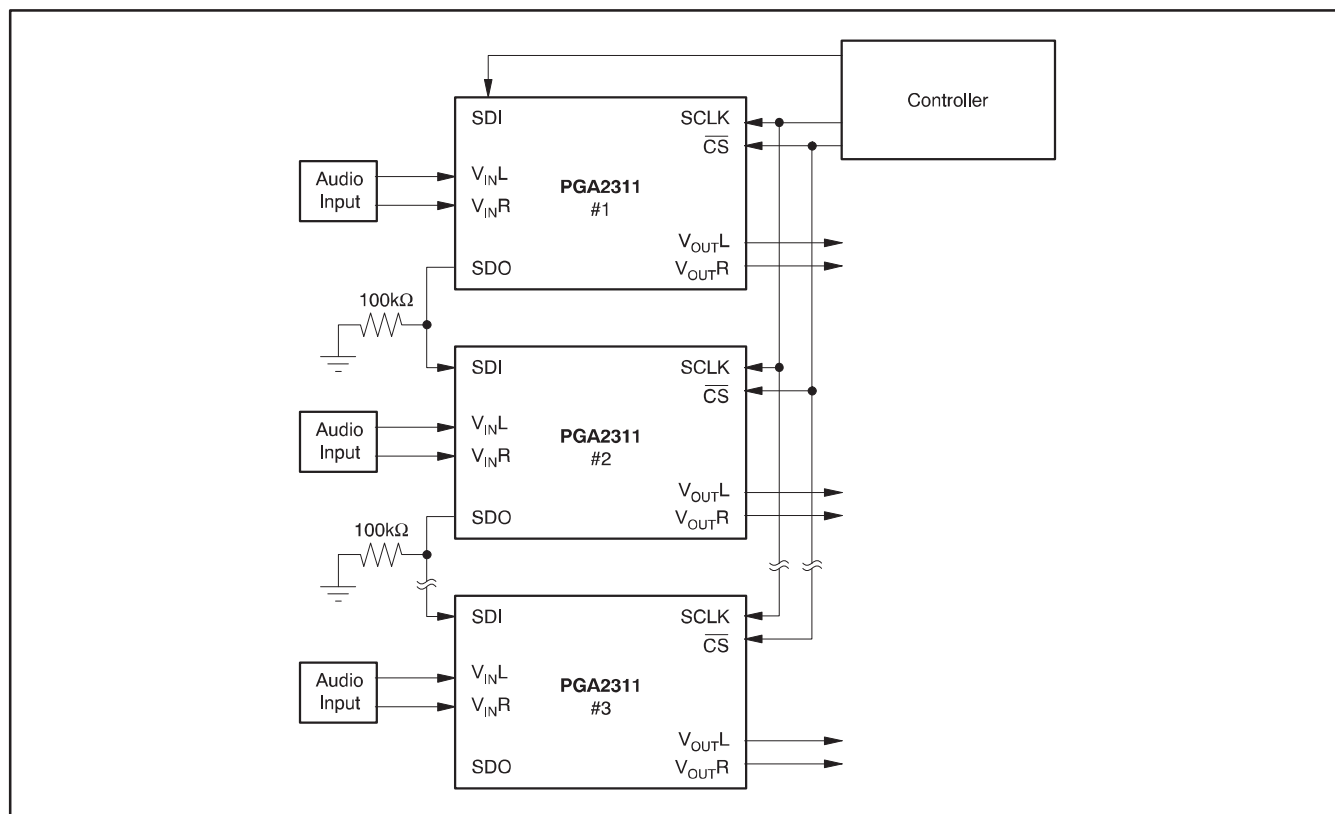

Figure 4. Daisy-Chaining Multiple PGA2311 Devices.

MUTE FUNCTION

Muting can be achieved by either hardware or software control. Hardware muting is accomplished via the $\overline{\text{MUTE}}$ input, and software muting by loading all zeroes into the volume control register.

$\overline{\text{MUTE}}$ disconnects the internal buffer amplifiers from the output pins and terminates A_{OUTL} and A_{OUTR} with $10\text{k}\Omega$ resistors to ground. The mute is activated with a zero crossing detection (independent of the zero cross enable status) or an 16ms time-out to eliminate any audible “clicks” or “pops”. $\overline{\text{MUTE}}$ also initiates an internal offset calibration.

A software mute is implemented by loading all zeroes into the volume control register. The internal amplifier is set to unity gain with the amplifier input connected to AGND.

APPLICATIONS INFORMATION

This section includes additional information that is pertinent to designing the PGA2311 into an end application.

RECOMMENDED CONNECTION DIAGRAM

Figure 5 depicts the recommended connections for the PGA2311. Power-supply bypass capacitors should be placed as close to the PGA2311 package as physically possible.

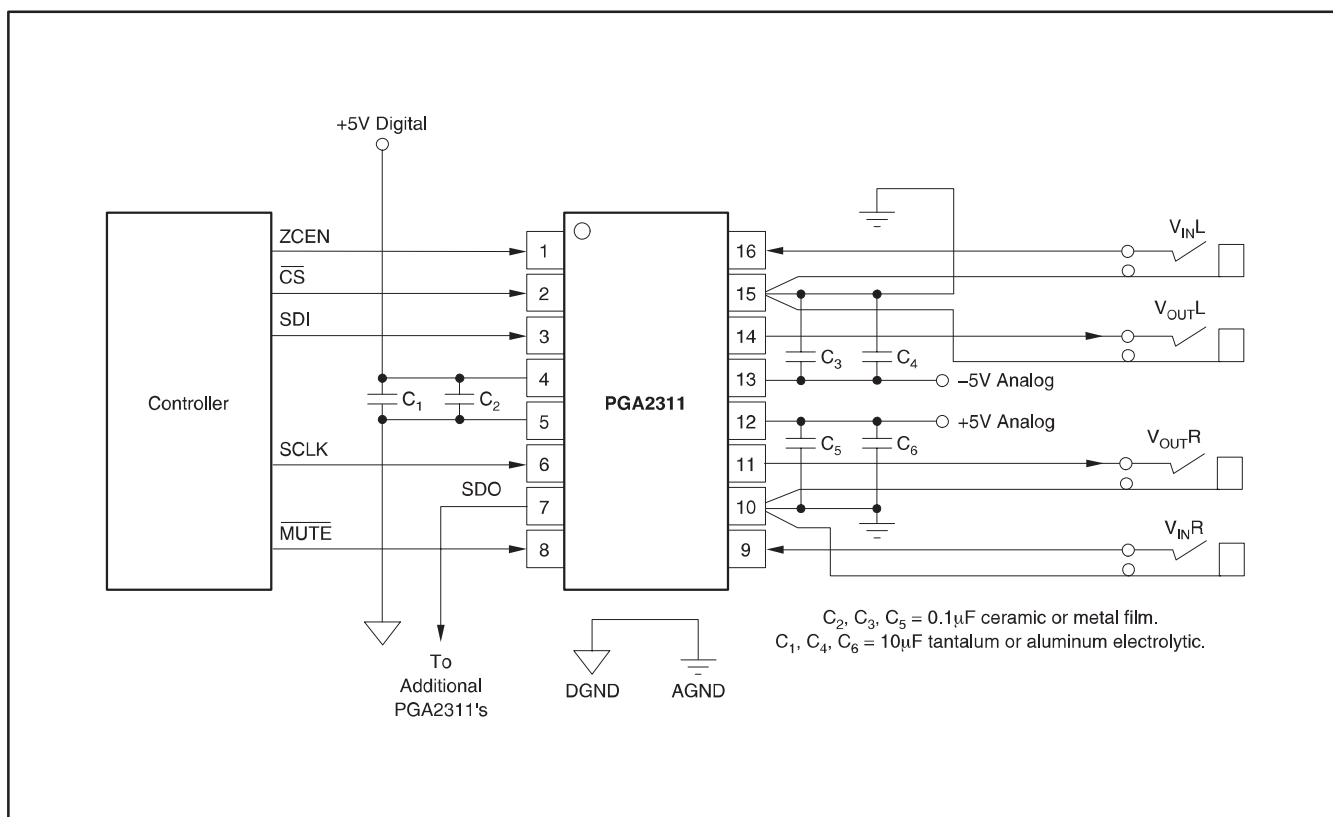

Figure 5. Recommended Connection Diagram.

PRINTED CIRCUIT BOARD (PCB) LAYOUT GUIDELINES

It is recommended that the ground planes for the digital and analog sections of the PCB be separate from one another. The planes should be connected at a single point. Figure 6 shows the recommended PCB floor plan for the PGA2311.

The PGA2311 is mounted so that it straddles the split between the digital and analog ground planes. Pins 1 through 8 are oriented to the digital side of the board, while pins 9 through 16 are on the analog side of the board.

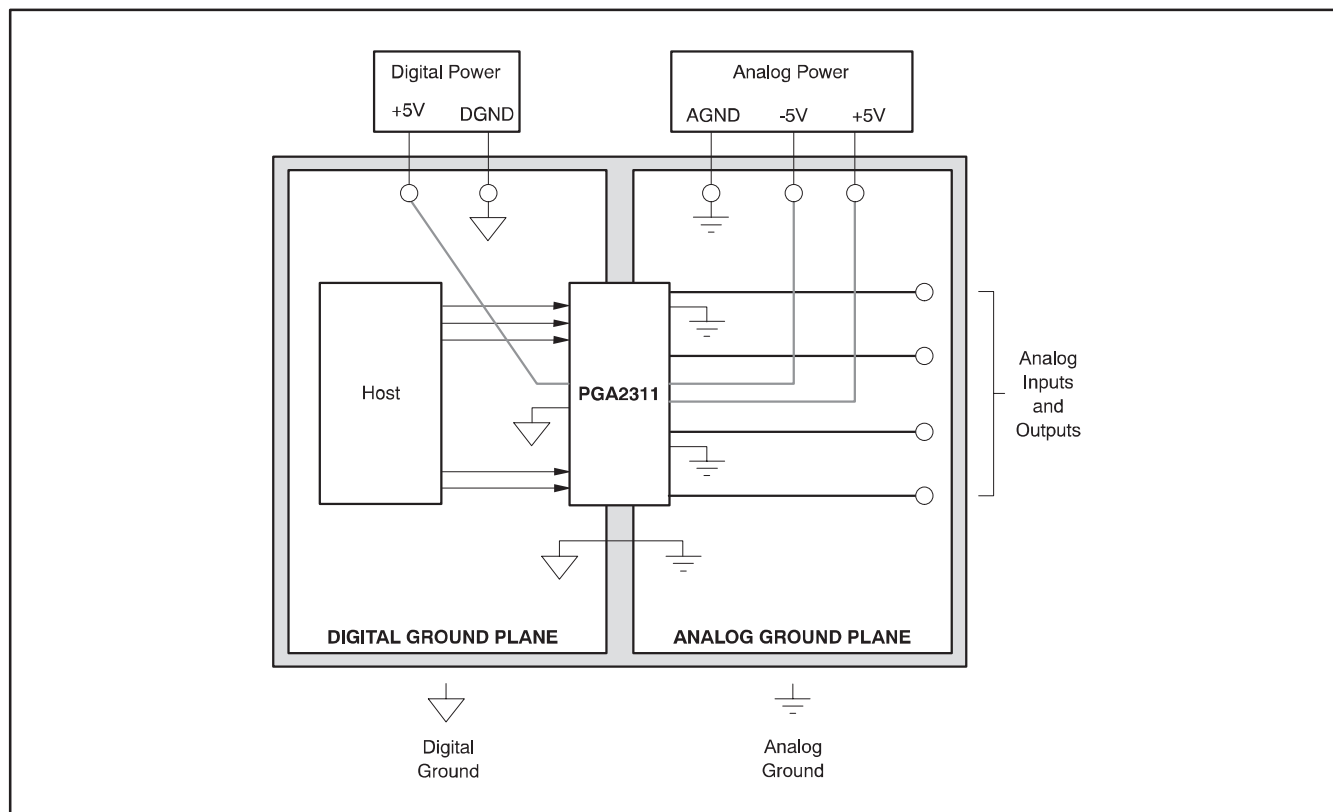

Figure 6. Typical PCB Layout Floor Plan.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46C and to discontinue any product or service per JESD48B. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components which meet ISO/TS16949 requirements, mainly for automotive use. Components which have not been so designated are neither designed nor intended for automotive use; and TI will not be responsible for any failure of such components to meet such requirements.
