

8-BIT UNIVERSAL BUS TRANSCEIVER AND TWO 1-BIT BUS TRANSCEIVERS WITH SPLIT LVTTTL PORT, FEEDBACK PATH, AND 3-STATE OUTPUTS

Check for Samples: [SN74VMEH22501A](#)

FEATURES

- Member of the Texas Instruments Widebus™ Family
- UBT™ Transceiver Combines D-Type Latches and D-Type Flip-Flops for Operation in Transparent, Latched, or Clocked Modes
- OEC™ Circuitry Improves Signal Integrity and Reduces Electromagnetic Interference (EMI)
- Compliant With VME64, 2eVME, and 2eSST Protocols
- Bus Transceiver Split LVTTTL Port Provides a Feedback Path for Control and Diagnostics Monitoring
- I/O Interfaces Are 5-V Tolerant
- B-Port Outputs (–48 mA/64 mA)
- Y and A-Port Outputs (–12 mA/12 mA)
- I_{off}, Power-Up 3-State, and BIAS V_{CC} Support Live Insertion
- Bus Hold on 3A-Port Data Inputs
- 26-Ω Equivalent Series Resistor on 3A Ports and Y Outputs
- Flow-Through Architecture Facilitates Printed Circuit Board Layout
- Distributed V_{CC} and GND Pins Minimize High-Speed Switching Noise
- Latch-Up Performance Exceeds 100 mA Per JESD 78, Class II
- ESD Protection Exceeds JESD 22
 - 2000-V Human-Body Model (A114-A)
 - 200-V Machine Model (A115-A)
 - 1000-V Charged-Device Model (C101)

DGG OR DGV PACKAGE

DESCRIPTION/ORDERING INFORMATION

The SN74VMEH22501A 8-bit universal bus transceiver has two integral 1-bit three-wire bus transceivers and is designed for 3.3-V V_{CC} operation with 5-V tolerant inputs. The UBT™ transceiver allows transparent, latched, and flip-flop modes of data transfer, and the separate LVTTTL input and outputs on the bus transceivers provide a feedback path for control and diagnostics monitoring. This device provides a high-speed interface between cards operating at LVTTTL logic levels and VME64, VME64x, or VME320⁽¹⁾ backplane topologies.

The SN74VMEH22501A is pin-for-pin compatible to the SN74VMEH22501 (TI literature number [SCES357](#)), but operates at a wider operating temperature (–40°C to 85°C) range.

(1) VME320 is a patented backplane construction by Arizona Digital, Inc.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

DESCRIPTION/ORDERING INFORMATION (CONTINUED)

High-speed backplane operation is a direct result of the improved OEC™ circuitry and high drive that has been designed and tested into the VME64x backplane model. The B-port I/Os are optimized for driving large capacitive loads and include pseudo-ETL input thresholds ($\frac{1}{2} V_{CC} \pm 50 \text{ mV}$) for increased noise immunity. These specifications support the 2eVME protocols in VME64x (ANSI/VITA 1.1) and 2eSST protocols in VITA 1.5. With proper design of a 21-slot VME system, a designer can achieve 320-Mbyte transfer rates on linear backplanes and, possibly, 1-Gbyte transfer rates on the VME320 backplane.

All inputs and outputs are 5-V tolerant and are compatible with TTL and 5-V CMOS inputs.

Active bus-hold circuitry holds unused or undriven 3A-port inputs at a valid logic state. Bus-hold circuitry is not provided on 1A or 2A inputs, any B-port input, or any control input. Use of pullup or pulldown resistors with the bus-hold circuitry is not recommended.

This device is fully specified for live-insertion applications using I_{off} , power-up 3-state, and BIAS V_{CC} . The I_{off} circuitry prevents damaging current to backflow through the device when it is powered off/on. The power-up 3-state circuitry places the outputs in the high-impedance state during power up and power down, which prevents driver conflict. The BIAS V_{CC} circuitry precharges and preconditions the B-port input/output connections, preventing disturbance of active data on the backplane during card insertion or removal, and permits true live-insertion capability.

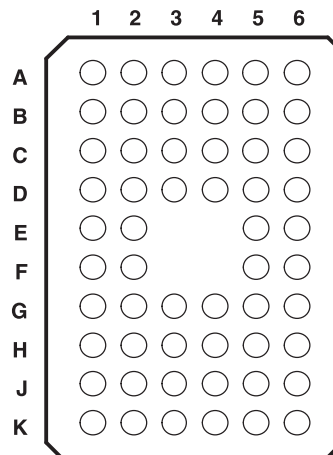

When V_{CC} is between 0 and 1.5 V, the device is in the high-impedance state during power up or power down. However, to ensure the high-impedance state above 1.5 V, output-enable (\overline{OE} and $\overline{OE}BY$) inputs should be tied to V_{CC} through a pullup resistor and output-enable (OEAB) inputs should be tied to GND through a pulldown resistor; the minimum value of the resistor is determined by the drive capability of the device connected to this input.

FUNCTIONAL DESCRIPTION

The SN74VMEH22501A is a high-drive (–48/64 mA), 8-bit UBT transceiver containing D-type latches and D-type flip-flops for data-path operation in transparent, latched, or flip-flop modes. Data transmission is true logic. The device is uniquely partitioned as 8-bit UBT transceivers with two integrated 1-bit three-wire bus transceivers.

Functional Description for Two 1-Bit Bus Transceivers

The OEAB inputs control the activity of the 1B or 2B port. When OEAB is high, the B-port outputs are active. When OEAB is low, the B-port outputs are disabled.

Separate 1A and 2A inputs and 1Y and 2Y outputs provide a feedback path for control and diagnostics monitoring. The $\overline{\text{OEBY}}$ inputs control the 1Y or 2Y outputs. When $\overline{\text{OEBY}}$ is low, the Y outputs are active. When $\overline{\text{OEBY}}$ is high, the Y outputs are disabled.

The $\overline{\text{OEBY}}$ and OEAB inputs can be tied together to form a simple direction control where an input high yields A data to B bus and an input low yields B data to Y bus.

1-BIT BUS TRANSCEIVER FUNCTION TABLE

INPUTS		OUTPUT	MODE
OEAB	$\overline{\text{OEBY}}$		
L	H	Z	Isolation
H	H	A data to B bus	True driver
L	L	B data to Y bus	
H	L	A data to B bus, B data to Y bus	True driver with feedback path

Functional Description for 8-Bit UBT Transceiver

The 3A and 3B data flow in each direction is controlled by the $\overline{\text{OE}}$ and direction-control (DIR) inputs. When $\overline{\text{OE}}$ is low, all 3A- or 3B-port outputs are active. When $\overline{\text{OE}}$ is high, all 3A- or 3B-port outputs are in the high-impedance state.

FUNCTION TABLE

INPUTS		OUTPUT
$\overline{\text{OE}}$	DIR	
H	X	Z
L	H	3A data to 3B bus
L	L	3B data to 3A bus

The UBT transceiver functions are controlled by latch-enable (LE) and clock (CLKAB and CLKBA) inputs. For 3A-to-3B data flow, the UBT operates in the transparent mode when LE is high. When LE is low, the 3A data is latched if CLKAB is held at a high or low logic level. If LE is low, the 3A data is stored in the latch/flip-flop on the low-to-high transition of CLKAB.

The UBT transceiver data flow for 3B to 3A is similar to that of 3A to 3B, but uses CLKBA.

Table 1. UBT TRANSCEIVER FUNCTION TABLE⁽¹⁾

INPUTS				OUTPUT 3B	MODE
\overline{OE}	LE	CLKAB	3A		
H	X	X	X	Z	Isolation
L	L	H	X	B ₀ ⁽²⁾	Latched storage of 3A data
L	L	L	X	B ₀ ⁽³⁾	
L	H	X	L	L	True transparent
L	H	X	H	H	
L	L	↑	L	L	Clocked storage of 3A data
L	L	↑	H	H	

- (1) 3A-to-3B data flow is shown; 3B-to-3A data flow is similar, but uses CLKBA.
 (2) Output level before the indicated steady-state input conditions were established, provided that CLKAB was high before LE went low
 (3) Output level before the indicated steady-state input conditions were established

The UBT transceiver can replace any of the functions shown in [Table 2](#).

Absolute Maximum Ratings⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT	
V_{CC} , BIAS V_{CC}	Supply voltage range	-0.5	4.6	V	
V_I	Input voltage range ⁽²⁾	-0.5	7	V	
V_O	Voltage range applied to any output in the high-impedance or power-off state ⁽²⁾	-0.5	7	V	
V_O	Voltage range applied to any output in the high or low state ⁽²⁾	3A port or Y output	-0.5	$V_{CC} + 0.5$	V
		B port	-0.5	4.6	
I_O	Output current in the low state	3A port or Y output		50	mA
		B port		100	
I_O	Output current in the high state	3A port or Y output		-50	mA
		B port		-100	
I_{IK}	Input clamp current	$V_I < 0$		-50	mA
I_{OK}	Output clamp current	$V_O < 0$ or $V_O > V_{CC}$, B port		-50	mA
θ_{JA}	Package thermal impedance ⁽³⁾	DGG package		70	°C/W
		DGV package		58	
		GQL/ZQL package		42	
T_{stg}	Storage temperature range	-65	150	°C	

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
- (3) The package thermal impedance is calculated in accordance with JESD 51-7.

Recommended Operating Conditions^{(1) (2)}

		MIN	NOM	MAX	UNIT
V_{CC} , BIAS V_{CC}	Supply voltage	3.15	3.3	3.45	V
V_I	Input voltage	Control inputs or A port		V_{CC}	V
		B port		V_{CC}	
V_{IH}	High-level input voltage	Control inputs or A port	2		V
		B port	$0.5 V_{CC} + 50$ mV		
V_{IL}	Low-level input voltage	Control inputs or A port		0.8	V
		B port		$0.5 V_{CC} - 50$ mV	
I_{IK}	Input clamp current			-18	mA
I_{OH}	High-level output current	3A port and Y output		-12	mA
		B port		-48	
I_{OL}	Low-level output current	3A port and Y output		12	mA
		B port		64	
$\Delta t/\Delta v$	Input transition rise or fall rate			10	ns/V
$\Delta t/\Delta V_{CC}$	Power-up ramp rate	20			μs/V
T_A	Operating free-air temperature	-40		85	°C

- (1) All unused control inputs of the device must be held at V_{CC} or GND to ensure proper device operation. Refer to the TI application report, *Implications of Slow or Floating CMOS Inputs*, literature number SCBA004.
- (2) Proper connection sequence for use of the B-port I/O precharge feature is GND and BIAS $V_{CC} = 3.3$ V first, I/O second, and $V_{CC} = 3.3$ V last, because the BIAS V_{CC} precharge circuitry is disabled when any V_{CC} pin is connected. The control inputs can be connected at any time, but normally are connected during the I/O stage. If B-port precharge is not required, any connection sequence is acceptable, but generally, GND is connected first.

Electrical Characteristics

over recommended operating free-air temperature range for A and B ports (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP ⁽¹⁾	MAX	UNIT
V_{IK}		$V_{CC} = 3.15\text{ V}$,	$I_I = -18\text{ mA}$			-1.2	V

I_{CC}		$V_{CC} = 3.45\text{ V}$, $I_O = 0$, $V_I = V_{CC}$ or GND	Outputs high			30	mA
			Outputs low			30	
			Outputs disabled			30	
I_{CCD}		$V_{CC} = 3.45\text{ V}$, $I_O = 0$, $V_I = V_{CC}$ or GND, One data input switching at one-half clock frequency, 50% duty cycle	Outputs enabled		76		$\mu\text{A}/$ clock MHz/ input
			Outputs disabled		19		
ΔI_{CC} ⁽⁸⁾		$V_{CC} = 3.15\text{ V to }3.45\text{ V}$, One input at $V_{CC} - 0.6\text{ V}$, Other inputs at V_{CC} or GND				750	μA

(1) All typical values are at $V_{CC} = 3.3\text{ V}$, $T_A = 25^\circ\text{C}$.

(2) For I/O ports, the parameters I_{OZH} and I_{OZL} include the input leakage current.

(3) The bus-hold circuit can sink at least the minimum low sustaining current at V_{IL} max. I_{BHL} should be measured after lowering V_{IN} to GND, then raising it to V_{IL} max.

(4) The bus-hold circuit can source at least the minimum high sustaining current at V_{IH} min. I_{BHH} should be measured after raising V_{IN} to V_{CC} , then lowering it to V_{IH} min.

(5) An external driver must source at least I_{BHLO} to switch this node from low to high.

(6) An external driver must sink at least I_{BHHO} to switch this node from high to low.

(7) High-impedance state during power up or power down

(8) This is the increase in supply current for each input that is at the specified TTL voltage level, rather than V_{CC} or GND.

Electrical Characteristics (continued)

Distributed-Load Backplane Switching Characteristics

The preceding switching characteristics tables show the switching characteristics of the device into the lumped load shown in the parameter measurement information (PMI) (see Figure 1 and Figure 2). All logic devices currently are tested into this type of load. However, the designer's backplane application probably is a distributed load. For this reason, this device has been designed for optimum performance in the VME64x backplane as shown in Figure 3.

† Unloaded backplane trace natural impedance (Z_0) is 45 Ω . 45 Ω to 60 Ω is allowed, with 50 Ω being ideal.
 ‡ Card stub natural impedance (Z_0) is 60 Ω .

Figure 3. VME64x Backplane

The following switching characteristics tables derived from TI-SPICE models show the switching characteristics of the device into the backplane under full and minimum loading conditions, to help the designer better understand the performance of the VME device in this typical backplane. See www.ti.com/sc/etl for more information.

Driver in Slot 11, With Receiver Cards in All Other Slots (Full Load)

Switching Characteristics for Bus Transceiver Function

over recommended operating conditions (unless otherwise noted) (see Figure 3)

PARAMETER	FROM (INPUT)	TO (OUTPUT)	MIN	TYP ⁽¹⁾	MAX	UNIT
t_{PLH}	1A or 2A	1B or 2B	5.9		8.5	ns
t_{PHL}			5.5		8.7	
$t_r^{(2)}$	Transition time, B port (10%–90%)		9	8.6	11.4	ns
$t_f^{(2)}$	Transition time, B port (90%–10%)		8.9	9	10.8	ns

(1) All typical values are at $V_{CC} = 3.3$ V, $T_A = 25^\circ\text{C}$. All values are derived from TI-SPICE models.
 (2) All t_r and t_f times are taken at the first receiver.

Switching Characteristics for UBT

over recommended operating conditions (unless otherwise noted) (see [Figure 3](#))

PARAMETER	FROM (INPUT)	TO (OUTPUT)	MIN	TYP ⁽¹⁾	MAX	UNIT
t_{PLH}	3A	3B	6.2		8.9	ns

(2) $t_{sk(t)}$ – Output-to-output skew is defined as the absolute value of the difference between the actual propagation delay for all outputs of the same packaged device. The specifications are given for specific worst-case V_{CC} and temperature and apply to any outputs switching in opposite directions, both low to high (LH) and high to low (HL) [$t_{sk(t)}$].

By simulating the performance of the device using the VME64x backplane (see [Figure 3](#)), the maximum peak current in or out of the B-port output, as the devices switch from one logic state to another, was found to be equivalent to driving the lumped load shown in [Figure 4](#).

Figure 4. Equivalent AC Peak Output-Current Lumped Load

In general, the rise- and fall-time distribution is shown in [Figure 5](#). Since VME devices were designed for use into distributed loads like the VME64x backplane (B/P), there are significant differences between low-to-high (LH) and high-to-low (HL) values in the lumped load shown in the PMI (see [Figure 1](#) and [Figure 2](#)).

Figure 5.

Characterization-laboratory data in Figure 6 and Figure 7 show the absolute ac peak output current, with different supply voltages, as the devices change output logic state. A typical nominal process is shown to demonstrate the devices' peak ac output drive capability.

VMEbus Summary

In 1981, the VMEbus was introduced as a backplane bus architecture for industrial and commercial applications. The data-transfer protocols used to define the VMEbus came from the Motorola™ VERSA bus architecture that owed its heritage to the then recently introduced Motorola 68000 microprocessor. The VMEbus, when introduced, defined two basic data-transfer operations: single-cycle transfers consisting of an address and a data transfer, and a block transfer (BLT) consisting of an address and a sequence of data transfers. These transfers were asynchronous, using a master-slave handshake. The master puts address and data on the bus and waits for an acknowledgment. The selected slave either reads or writes data to or from the bus, then provides a data-acknowledge (DTACK*) signal. The VMEbus system data throughput was 40 Mbyte/s. Previous to the VMEbus, it was not uncommon for the backplane buses to require elaborate calculations to determine loading and drive current for interface design. This approach made designs difficult and caused compatibility problems among manufacturers. To make interface design easier and to ensure compatibility, the developers of the VMEbus architecture defined specific delays based on a 21-slot terminated backplane and mandated the use of certain high-current TTL drivers, receivers, and transceivers.

In 1989, multiplexing block transfer (MBLT) effectively increased the number of bits from 32 to 64, thereby doubling the transfer rate. In 1995, the number of handshake edges was reduced from four to two in the double-edge transfer (2eVME) protocol, doubling the data rate again. In 1997, the VMEbus International Trade Association (VITA) established a task group to specify a synchronous protocol to increase data-transfer rates to 320 Mbyte/s, or more. The unreleased specification, VITA 1.5 [double-edge source synchronous transfer (2eSST)], is based on the asynchronous 2eVME protocol. It does not wait for acknowledgement of the data by the receiver and requires incident-wave switching. Sustained data rates of 1 Gbyte/s, more than ten times faster than traditional VME64 backplanes, are possible by taking advantage of 2eSST and the 21-slot VME320 star-configuration backplane. The VME320 backplane approximates a lumped load, allowing substantially higher-frequency operation over the VME64x distributed-load backplane. Traditional VME64 backplanes with no changes theoretically can sustain 320 Mbyte/s.

From BLT to 2eSST – A Look at the Evolution of VMEbus Protocols by John Rynearson, Technical Director, VITA, provides additional information on VMEbus and can be obtained at www.vita.com.

Maximum Data Transfer Rates

DATE	TOPOLOGY	PROTOCOL	DATA BITS PER CYCLE	DATA TRANSFERS PER CLOCK CYCLE	PER SYSTEM (Mbyte/s)	FREQUENCY (MHz)	
						BACKPLANE	CLOCK
1981	VMEbus IEEE-1014	BLT	32	1	40	10	10
1989	VME64	MBLT	64	1	80	10	10
1995	VME64x	2eVME	64	2	160	10	20
1997	VME64x	2eSST	64	2-No Ack	160–320	10–20	20–40
1999	VME320	2eSST	64	2-No Ack	320–1000	20–62.5	40–125

Applicability

Target applications for VME backplanes include industrial controls, telecommunications, simulation, high-energy physics, office automation, and instrumentation systems.

PACKAGING INFORMATION

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
