Read Mode . . . 2.5 μ s Max
- **No External Clock or Oscillator Components Required**
- **On-Chip Track and Hold**
- **Single 5-V Supply**
- **TLC0820A Is Direct Replacement for National Semiconductor ADC0820C/CC and Analog Devices AD7820K/B/T**

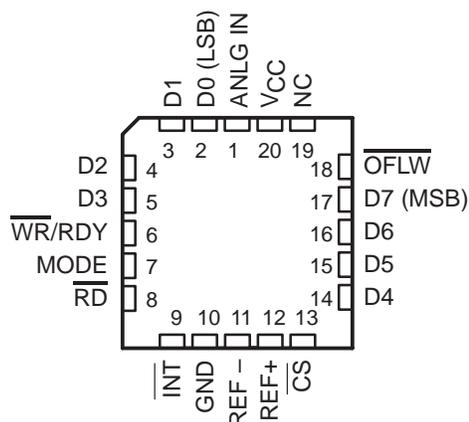

description

The TLC0820AC and the TLC0820AI are Advanced LinCMOS™ 8-bit analog-to-digital converters each consisting of two 4-bit flash converters, a 4-bit digital-to-analog converter, a summing (error) amplifier, control logic, and a result latch circuit. The modified flash technique allows low-power integrated circuitry to complete an 8-bit conversion in 1.18 μ s over temperature. The on-chip track-and-hold circuit has a 100-ns sample window and allows these devices to convert continuous analog signals having slew rates of up to 100 mV/ μ s without external sampling components. TTL-compatible 3-state output drivers and two modes of operation allow interfacing to a variety of microprocessors. Detailed information on interfacing to most popular microprocessors is readily available from the factory.

Terminal Functions

TERMINAL NAME NO.	I/O	DESCRIPTION
ANLG IN 1	I	Analog input
\overline{CS} 13	I	Chip select. \overline{CS} must be low in order for \overline{RD} or \overline{WR} to be recognized by the ADC.
D0 2	O	Digital, 3-state output data, bit 1 (LSB)
D1 3	O	Digital, 3-state output data, bit 2
D2 4	O	Digital, 3-state output data, bit 3
D3 5	O	Digital, 3-state output data, bit 4
D4 14	O	Digital, 3-state output data, bit 5
D5 15	O	Digital, 3-state output data, bit 6
D6 16	O	Digital, 3-state output data, bit 7
D7 17	O	Digital, 3-state output data, bit 8 (MSB)
GND 10		Ground
\overline{INT} 9	O	Interrupt. In the write-read mode, the interrupt output (\overline{INT}) going low indicates that the internal count-down delay time, $t_{d(int)}$, is complete and the data result is in the output latch. The delay time $t_{d(int)}$ is typically 800 ns starting after the rising edge of \overline{WR} (see operating characteristics and Figure 3). If \overline{RD} goes low prior to the end of $t_{d(int)}$, \overline{INT} goes low at the end of $t_{d(RLL)}$ and the conversion results are available sooner (see Figure 2). \overline{INT} is reset by the rising edge of either \overline{RD} or \overline{CS} .
MODE 7	I	Mode select. MODE is internally tied to GND through a 50- μ A current source, which acts like a pulldown resistor. When MODE is low, the read mode is selected. When MODE is high, the write-read mode is selected.
NC 19		No internal connection
\overline{OFLW} 18	O	Overflow. Normally \overline{OFLW} is a logical high. However, if the analog input is higher than V_{ref+} , \overline{OFLW} will be low at the end of conversion. It can be used to cascade two or more devices to improve resolution (9 or 10 bits).
\overline{RD} 8	I	Read. In the write-read mode with \overline{CS} low, the 3-state data outputs D0 through D7 are activated when \overline{RD} goes low. \overline{RD} can also be used to increase the conversion speed by reading data prior to the end of the internal count-down delay time. As a result, the data transferred to the output latch is latched after the falling edge of \overline{RD} . In the read mode with \overline{CS} low, the conversion starts with \overline{RD} going low. \overline{RD} also enables the 3-state data outputs on completion of the conversion. RDY going into the high-impedance state and \overline{INT} going low indicate completion of the conversion.
REF– 11	I	Reference voltage. REF– is placed on the bottom of the resistor ladder.
REF+ 12	I	Reference voltage. REF+ is placed on the top of the resistor ladder.
VCC 20		Power supply voltage
\overline{WR}/RDY 6	I/O	Write ready. In the write-read mode with \overline{CS} low, the conversion is started on the falling edge of the \overline{WR} input signal. The result of the conversion is strobed into the output latch after the internal count-down delay time, $t_{d(int)}$, provided that the \overline{RD} input does not go low prior to this time. The delay time $t_{d(int)}$ is approximately 800 ns. In the read mode, RDY (an open-drain output) goes low after the falling edge of \overline{CS} and goes into the high-impedance state when the conversion is strobed into the output latch. It is used to simplify the interface to a microprocessor system.

PRINCIPLES OF OPERATION

The TLC0820AC and TLC0820AI each employ a combination of sampled-data comparator techniques and flash techniques common to many high-speed converters. Two 4-bit flash analog-to-digital conversions are used to give a full 8-bit output.

The recommended analog input voltage range for conversion is -0.1 V to $V_{CC} + 0.1\text{ V}$. Analog input signals that are less than $V_{ref-} + 1/2\text{ LSB}$ or greater than $V_{ref+} - 1/2\text{ LSB}$ convert to 00000000 or 11111111, respectively. The reference inputs are fully differential with common-mode limits defined by the supply rails. The reference input values define the full-scale range of the analog input. This allows the gain of the ADC to be varied for ratiometric conversion by changing the V_{ref+} and V_{ref-} voltages.

The device operates in two modes, read (only) and write-read, that are selected by MODE. The converter is set to the read (only) mode when MODE is low. In the read mode, \overline{WR}/RDY is used as an output and is referred to as the ready terminal. In this mode, a low on \overline{WR}/RDY while \overline{CS} is low indicates that the device is busy. Conversion starts on the falling edge of \overline{RD} and is completed no more than $2.5\text{ }\mu\text{s}$ later when \overline{INT} falls and \overline{WR}/RDY returns to the high-impedance state. Data outputs also change from high-impedance to active states at this time. After the data is read, \overline{RD} is taken high, \overline{INT} returns high, and the data outputs return to their high-impedance states.

When MODE is high, the converter is set to the write-read mode and \overline{WR}/RDY is referred to as the write terminal. Taking \overline{CS} and \overline{WR}/RDY low selects the converter and initiates measurement of the input signal. Approximately 600 ns after \overline{WR}/RDY returns high, the conversion is completed. Conversion starts on the rising edge of \overline{WR}/RDY in the write-read mode.

The high-order 4-bit flash ADC measures the input by means of 16 comparators operating simultaneously. A high-precision 4-bit DAC then generates a discrete analog voltage from the result of that conversion. After a time delay, a second bank of comparators does a low-order conversion on the analog difference between the input level and the high-order DAC output. The results from each of these conversions enter an 8-bit latch and are output to the 3-state output buffers on the falling edge of \overline{RD} .

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check

<http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
