

Smart Power Switch

FEATURES

- 300mA Continuous Output Current
- Low Side or High Side Switch Configuration
- 8V to 65V Operation
- Overload and Short Circuit Protection
- Power Interruption Protection
- +6V Regulated Voltage
- 2mA Quiescent Current
- Programmable Overcurrent and Power Interruption Protection
- 1% to 30% Programmable Input Comparator Hysteresis (on UC37132)
- Low and High Side Internal High Current Clamps When Driving Inductive Loads

DESCRIPTION

The UC37131, UC37132 and UC37133 are a family of smart power switches which can drive resistive or inductive loads from the high side or low side.

The UC37132 is available in 14 pin (DIP), 16 pin (SOIC), or 20 pin (CLCC) packages and can accommodate both low side (load to VCC) or high side (load to GND) configurations. The UC37131 and UC37133 are exclusively for a low side or a high side configuration respectively and both are available in an 8 pin package. Both high side and low side configurations provide high current switching with low saturation voltages which can drive resistive or inductive loads.

The input to the switch is driven by a low voltage signal, typically 5V. Additionally, UC37132 features adjustable hysteresis. The output of the device can switch a load between 8V and 65V. Output current capability is 300mA continuous or 700mA peak.

The device also has inherent smart features that allow for programmable turn-on delay in enabling the output following startup. The same capacitor that specifies the turn-on delay is also used to program a VCC power interruption time. If VCC drops below a threshold for a time specified by this capacitor, the output is turned off and a new turn-on delay will be re-triggered. Similarly, if high current persists longer than the response delay, the output driver will operate in a very low duty cycle mode to protect the IC.

PIN DESCRIPTIONS

CDEL: A capacitor connected to this pin is used to program both VCC pulse interruption time and power turn-on delay. The capacitor discharge time corresponds to VCC interruption and the charge time to VCC turn-on delay. The ratio between turn-on delay and turn-off delay will be fixed based on internal charge and discharge currents and voltage thresholds.

The same fault circuitry and capacitor is used for short circuit and overload protection. If an overcurrent or short circuit is detected, the capacitor starts charging and turns off the output if the condition persists at the end of its charge time. The output will then operate in a low-duty cycle mode to protect the IC. After short circuit recovery, the output will be reactivated in order to check if the short circuit was removed. If the overcurrent persists the chip will continue in this pulsing mode.

CSH: (For UC37132 and UC37133) This high side current sense pin is used to program the current limit for high side applications by connecting a resistor between VCC and CSH. An over load current is detected when the voltage drop between VCC and CSH exceeds 150mV. For the UC37132, in a high side application, the CSH pin must be tied to the LS pin; in a low side application, the CSH pin must be tied to VCC

CSL: (For UC37131 and UC37132) This low side current sense pin is used to program the current limit for low side applications by connecting a resistor between CSL and GND. An over load current is detected when the voltage drop between CSL and GND exceeds 150mV. For the UC37132, in a high side application, the CSL pin must be tied to GND; in a low side application, the CSL pin must be tied to the HS pin.

GND: The reference point for the internal reference, all thresholds, and the return for the remainder of the device.

HS: (For UC37132 and UC37133) The output of the switching transistor in the high side configuration. The emitter of the output transistor is the HS pin which is connected to the load. For the UC37132, the HS pin must be tied to the CSL pin in a low side application.

HYST: (For UC37132) The pin used to program the input comparator hysteresis by connecting a resistor to ground. The hysteresis defaults to 30% with HYST grounded (internally for UC37131 and UC37133).

$$V_{HYST} = \frac{3000}{(3330 + R_{HYST})}$$

IN: The input to the comparator that detects when the output transistor should be turned on. The input threshold is 3.0V (1/2 VREF) and the input voltage range is 0V to VREF.

LED: Open collector output intended to drive an LED. This pin is driven low whenever the output is turned off and is externally pulled high when the output is turned on (see Fig. 3b and 3c).

LS: (For UC37131 and UC37132) The output of the switching transistor in the low side configuration. The collector of the output transistor is the LS pin which is connected to the load. For the UC37132, the LS pin must be tied to the CSH pin in a high side application.

VREF: The 6V regulated reference capable of supplying up to 8mA. The recommended decoupling capacitor is 1nF.

VCC: The supply voltage for the chip. Decouple this pin with a good quality ceramic capacitor to ground.

DESCRIPTION OF OPERATION

Reference

The UC37131/2/3 family of devices features a 6V bandgap reference that is used to bias on-chip logic. Although the 6V reference is not trimmed, this bandgap reference provides less than 200ppm/°C. It is also used to generate the on-chip 3V input comparator threshold and is needed for the programmable hysteresis. The on-chip reference has 8mA maximum current sourcing capacity that is designed to power up external circuitry.

Input Comparator

The input comparator is a high gain comparator with hysteresis that fully switches with either a small signal (30mV, minimum for 1% hysteresis) or a logic signal (0 to 6V max). Only a 5mV overdrive of the 3V threshold is needed to switch the driver.

The hysteresis is set to 30% on the UC37131 and UC37133. (This is 30% of 3V equating to 0.9V of hysteresis.) On the UC37132 it is programmable from 1% to 30%.

Fault Logic

The output of the comparator is logic ANDed with the output of the fault logic. If a fault, either a power interrupt or an overcurrent condition, persists longer than it takes for the CDEL to discharge from its V_{CDEL_MAX} level of 5.8V to its V_{FAULT_L} of 1.3V, the fault protection block will output a logic 0 to the NAND gate and turn off the output driver. If the fault goes away prior to CDEL being discharged to 1.3V, the chip will resume normal operation without going through a turn-on delay.

The power interrupt normal operation consists of the chip turning the driver immediately back on if the interrupt goes away prior to CDEL reaching its lower threshold as described above. The CDEL capacitor is chosen based upon the maximum power interrupt time (t_{INT}) allowed without the output experiencing a turn-on delay. This interrupt time must be less than $t_{D(OFF)}$ where $t_{D(OFF)}$ is equal to the time it takes the CDEL capacitor to discharge from V_{CDEL_MAX} (5.8V) to V_{FAULT_L} (1.3V) with a discharge current of approximately 94 μ A. If the power stays off only as long as $t_{D(OFF)}$, the minimum power up delay will be equal to the time it takes to charge CDEL from V_{FAULT_L} (1.3V) to V_{FAULT_H} (4.9V) with a charge

current of approximately 4 μ A. If the power stays off longer than this time, then a power up delay will be initialized once power is resumed. This delay is the time it takes for CDEL to charge from 0V to V_{FAULT_H} of 4.9V.

The overcurrent fault normal operation consists of the chip staying off until CDEL fully recharges to V_{FAULT_H} of 4.9V. This is $t_{R(OFF)}$. Once CDEL reaches 4.9V, the driver will turn back on. If the overcurrent fault is still present, the chip will operate in a very low duty cycle (approximately 0.7%) based on the discharge (driver on) and charge time (driver off) of the CDEL capacitor. This overcurrent timing makes the chip act "smart" by allowing very high currents needed to drive large capacitive loads without setting off an overcurrent fault.

The overcurrent and current limit thresholds are programmed with the resistor R_{CSH} from CSH to VCC (high side) or R_{CSL} from CSL to GND (low side). For example, a 150mV ($I_{LOAD} \cdot R_{CSH}$) threshold will set the high side overcurrent fault threshold. An overall short circuit protection threshold is set at 300mV. Therefore, the recommended R_{CSH} of 0.5 Ω will result in the 600mA short circuit. By changing the R_{CSH} value the user can optimally set the overcurrent and short circuit current limits.

Output Driver

Once the turn-on signal is gated through from the input comparator, the output transistor is turned on. The output drive transistor is a composite PNP, NPN structure. This is a specially designed structure that keeps all the drive current needed for the load to be sourced through the LS pin. This keeps the overall power dissipation to less than 4mA independent of the load.

The output driver also has a 72V zener diode wired between its base and collector. This allows the output to swing and clamp to 72V above ground when discharging an inductive load in a low side application. The inductive zener clamp can discharge the 250mA to 400mA full load current. This consequently allows the LS pin to safely swing above VCC. Similarly, the 72V zener diode will allow the HS pin to safely swing and clamp 72V below LS/VCC when discharging an inductive load in a high side application. This 72V zener diode simplifies the user application by eliminating the need for external clamp diodes.

APPLICATION INFORMATION

Choosing The CDEL Capacitor

The maximum amount of time that VCC power can be interrupted and not require the outputs to go through a turn-on delay cycle is user programmable by the CDEL capacitor value. While VCC is interrupted, the outputs will be in an indeterminate state and they may turn off during this interval, t_{INT} . However, as long as the programmed interruption time is not exceeded, the outputs will immediately turn back on with the return of VCC.

For example:

$$t_{INT} \approx 500\mu\text{s} \text{ (User specified)}$$

CDEL is selected such that the time it takes for this capacitor to discharge from V_{CDEL_MAX} (5.8V) to V_{FAULT_L} (1.3V) with a discharge current of $94\mu\text{A}$ is just greater than this t_{INT} . This time is referred to as $t_{D(OFF)}$ in Fig. 3b.

$$CDEL = \frac{I_{DISCHARGE} \cdot t_{D(OFF)}}{V_{CDEL_MAX} - V_{FAULT_L}}$$

If $t_{D(OFF)}$ is set equal to t_{INT} , which the user has selected to be $500\mu\text{s}$, the minimum CDEL capacitor is calculated:

$$CDEL = \frac{94\mu\text{A} \cdot 500\mu\text{s}}{5.8\text{V} - 1.3\text{V}}$$

For this application, the CDEL capacitor value calculates to 10.4nF . By using a 10nF capacitor on CDEL, VCC can be interrupted for up to $478\mu\text{s}$ and the outputs will experi-

ence an indeterminate state during this interruption, but resume normal operation when VCC power returns to normal.

If the VCC power is interrupted for a time equal to or longer than $t_{D(OFF)}$ then the following relationships apply. As the CDEL capacitor discharges past the V_{FAULT_L} threshold, the output is fully disabled and must cycle through a power up delay equal to $t_{D(ON)}$. The charge current for the CDEL capacitor is equal to $4\mu\text{A}$. The outputs will turn on when the CDEL capacitor charges up to the V_{FAULT_H} threshold of 4.9V . The minimum turn-on delay the outputs will experience will occur if t_{INT} is exactly equal to the $t_{D(OFF)}$ time and the CDEL capacitor has only discharged to V_{FAULT_L} . This would be the minimum turn-on delay time and is calculated with the following equation:

$$t_{D(ON)\min} = \frac{CDEL \cdot |V_{FAULT_L} - V_{FAULT_H}|}{I_{CHARGE}}$$

Using the 10nF CDEL capacitor, for example, the minimum turn-on delay calculates to 9ms . If the CDEL capacitor discharges completely to zero, then the 10nF CDEL capacitor would cause a turn-on delay of 12.25ms . The outputs would be off for this amount of time after VCC power is restored. The total amount of time the outputs could be disabled is equal to the t_{INT} time, which may include the indeterminate time of $t_{D(OFF)}$, and the $t_{D(ON)}$ time, as shown in Fig. 3b.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
